EXPLORATION
FACILITATION
UNLIMITED

ASSESSMENT REPORT ON EXPLORATION ACTIVITIES, URBAN BARRY PROPERTY – MAY, JUNE, AUGUST 2016

Abby Peterson, P. Geo.
January 20th, 2017

Table of Contents

1. Introduction

The following report discusses the exploration activities carried out on the Urban Barry and Lac Chanceux claims (Urban Barry Property), their results and associated recommendations. These activities were completed by Exploration Facilitation Unlimited Inc. ("EFU") on behalf of Vorenus Metal Corp. ("Vorenus") in May, June and August of 2016.

The Urban Barry Property is located approximately 120km east of the town of Lebel-sur-Quévillon which is in turn approximately 650km north of Montreal and 260km north east of Val-d'Or QC. The Property consists of two claim blocks: the main Urban-Barry claim block consisting of twenty (20) claims and three (3) additional claims on Lac Chanceux, approximately 6km south of the main block. The claims are centered on 5,437,088mN and 468,237mE (zone 18T) and are located on NTS sheet 32G03. The Urban Barry property falls under the municipality of Eeyou-Istchee James Bay and as such, is subject to the various agreements associated with this municipality.

In early 2016, EFU was tasked with reviewing all the available data for the Urban Barry property, analyzing previous results and interpretations and recommending appropriate exploration work for moving the claims forward. Previous exploration activities in the area have been limited and the currently available data consists mainly of geophysical surveys and some geological mapping (where outcropping is available). Several known structures cross the property, including the large-scale Urban Deformation Zone, which cuts across the center of the main claim block in a roughly NNE-SSW direction. The geophysical data also shows several strong magnetic anomalies cutting across both the top and bottom of the main claim block, as well as through two of the three Lac Chanceux claims. For this reason, top priority was given to these areas during the exploration programs. From May 16th to June 15th 2016, field crews

completed 89.3 line km of Beep Mat grid, 57.6 line kilometers of VLF-EM/Mag, collected 244 soil samples and completed 15 diamond drill holes.

A second crew revisited the Urban Barry property from August 10th to 17th 2016 to conduct additional soil sampling after initial soil assay results returned several anomalous values. Due to the sparse amount of data, contouring was impossible to do with confidence, thus, crews completed tightly-spaced soil sampling in areas with previously identified anomalies. In total, they collected an additional 282 soil samples.

2. Geographical Setting

2.1 Location, Access and Infrastructure

The Urban-Barry Project is located mid-way between the Val-d'Or and Chibougamau mining camps. The main claim block falls within Belmont Township, while the Lac Chanceux claims are in Lacroix Township. The entire property can be located on National Topographic System (NTS) sheet 32G03 with a central reference point located at 49.085827° latitude and -75.435010° longitude and 5,437,088mN; 468,237mE UTM NAD 83 Zone 18T. Figure 1 shows the location of the claims on a small regional scale while figure 2 shows the claims on a larger local scale with township lines and roads as references.

The Urban Barry property is in Northwestern Quebec, approximately 675km NNE of the city of Montreal, 275km north-east of Val d'Or and 120km east of Lebel-sur-Quévillon. The property is accessed via a series of maintained and unmaintained gravel logging/mining roads starting at the city of Lebel-sur-Quévillon. The main claim block at Urban Barry is composed of twenty (20) contiguous claims totaling 1127.44 hectares with an additional 169.23 hectares covering three (3) claims at Lac Chanceux.

The property can be accessed year-round by truck, ATV/snowmobile and foot. Lebel-sur-Quévillon lies within 4km of highway 113; approximately 125km north of the Transcanadian highway linking Montreal to Val-d'Or (highway 117). From Lebel-sur-Quévillon, the property is accessed by driving 11km on the very well maintained road out of Lebel (#1000), then driving 67km on the 5000 before turning onto the 6000. From here it's approximately 50-60km before turning onto an unmaintained logging road. The claim boundary is 7-8km down this unmaintained logging road. This access point to the property is where EFU built their base camp for the duration of the exploration activities. The camp consisted of a mess/dining tent and a dry tent. Individuals slept in 4-6 man tents. Access to the east side of the main claim block can be gained from Chibougamau or Chapais, however once off the main highway, the forestry roads are ill-maintained and mostly impassable. The main block is cut in half by the Saint-Cyr River. In order to cross this river in the summer, a raft was constructed, capable of carrying people and ATVs safely across. This allowed crews to work on the eastern portion of the claim block and access the Lac Chanceux claims. The three Lac Chanceux claims are approximately 6km south of the main block and are accessed from the main claim block via logging roads that are in good condition.

From Val-d'Or it is an approximately 4-hour drive to the Urban Barry base camp. In turn, Val-d'Or is a 6-hour drive (or a 75-minute flight) from Montreal, 526km to the south-east. Air Canada offers daily service between Montreal and Val-d'Or using its fleet of Dash-8 aircraft. Val-d'Or is a well-serviced city with a population of approximately 32,000 people and amenities that include numerous hotels and restaurants as well as equipment rental companies. Groceries, equipment and supplies can be purchased at any number of stores in Val d'Or, and is a good place to pick up a big order of food and supplies before heading to Urban Barry. Lebel-sur-Quévillon also has several restaurants in addition to grocery and supply stores, however the town is much smaller and selections can be limited. The town does however provide an excellent place to pick up small items in between orders and to access the internet as needed. The Urban-Barry base camp falls outside cell phone range making daily communications for safety check-ins and ordering supplies

sometimes challenging. A satellite phone was the only means of communication while on site and call quality was often poor. Cell phone service picks up again just outside the town of Lebel.

Due to a good portion of the property overlying swamp, fieldwork in these areas is best completed while the ground is frozen. The rest of the property can be accessed and explored year-round on foot with access by foot or ATV via logging roads.

2.2 Climate, Topography and Vegetation

The Urban-Barry region experiences a continental to borderline subarctic climate. Winters are relatively cold with an average daily temperature ranging from -4.0°C to -17.7°C and an average minimum temperature of -23.4°C in January. Summers are warm with average daily temperatures of 14.2°C to 17.1°C and an average daily maximum of 23.1°C in July. Precipitation ranges from an average of 29.6mm in February to 122.9mm in July (Climate Canada website).

Topography on the Urban-Barry property is typical of the Canadian Shield. The area is relatively flat and low-lying with very few hills, ridges or other increases in elevation (max. 50m). Because of this, the area is poorly drained and consists of a large proportion of swamps and muskegs. The Urban-Barry property's main claim block is bisected by the St-Cyr River. All waters in the area eventually drain into James Bay by way of the Opawica, Waswanipi and Mégiscane Rivers (Joly, 1990). Vegetation consists predominantly of conifers (Spruce, Pine and Fir) with minor deciduous species (Birch, Aspen and Poplar). Most of the unmaintained logging roads are overgrown with Alders.

Significant overburden at Urban-Barry has been the main limiting factor to exploration in the past. Depth can range from 0-60m in thickness and average over 25m. Due to the low-lying relief and the thickness of overburden, there is very little outcropping on the property, which tends to only be found in the few areas where topographic relief is present.

3. Property

3.1 Mineral Claims

The property consists of two claim blocks totaling 1,296.67 hectares: the main Urban-Barry block and the Lac Chanceux claims. The main block is composed of twenty (20) contiguous claims totaling 1127.44 hectares. The Lac Chanceux claims comprise three (3) contiguous claims totaling 169.23 hectares. Aldever acquired a 100% interest in the Urban Barry Gold Project in November 2015 when they entered into an agreement with Urania Resource Corp. The agreement included the issuance of 3.5 million shares, a $250,000 payment and by incurring $1M in qualifying exploration expenditures over a five-year period. In December 2015, Aldever acquired a 100% interest in the Lac Chanceux gold claims by entering into an agreement with Garmin Metals and Mining Corp. The agreement included the issuing of 300,000 common shares, a $50,000 payment and by incurring $200,000 in qualifying exploration expenditures over a five-year term. The claims can be found listed in Table 1 below and their locations are plotted in Figure 2.

	Total:	1,296.67		

3.2 Exploration Expenditures

Expenditure Type	Expenditure Amount (CAD$)
Travel and Lodging	16,776
Food and Perishable Supplies	14,165
Fuel	4,105
Rentals:	
Radio and Satellite Telephone	1,172
ATV	8,501
Truck	5,455
Beep Mat	2,000
Geophysical VLF/EM and Magnetometer	8,400
Drill Rentals	5,362
Geophysical surveys	130,095
Soil sampling surveys	80,127
Geological surveying and sampling	1,490

Assays	27,261
Data processing	4,249
Geophysical Interpretation	6,278
Report	8,000
Total	**323,436**

3.3 History and Previous Exploration

Historically, the claims that make up the Urban Barry property have been underexplored. However, the region surrounding the property contains numerous showings and deposits, providing ample evidence of potential in the area. Since the 1994 discovery of the Barry deposit by Murgor Resources, exploration efforts in the area have dramatically increased, resulting in the discovery of multiple deposits and showings, including: The Windfall Lake deposit, the Nubar deposit, the Belmont showing and the Lac Chanceux Nord Cu showing. The bulk of the historical work involves large-scale geological and geophysical surveys that included parts or all of the claims within their scope.

The earliest reports related to work completed on the Urban-Barry claims consists of large-scale geological investigations undertaken by B.C. Freeman (RP142A) and R.L. Milner (RG014A) for the Province of Québec's Department of Mines in 1939. Before this, most of the territory had been either unmapped, or had been the subject of reconnaissance exploration. The discovery of massive sulfides carrying low anomalous gold values as well as the discover of free gold in quartz veins prompted an interest in the Buteux region of the Abitibi (Freeman, 1939). Milner's work (geological mapping) covered the entire claim block westward towards Lac Windfall and Lac Barry, whereas Freeman's territory (investigating mineral indices and a geological survey) extended east from the western edge of Lac Chanceux, covering Lac Hébert eastward past the Pascagama River into Marceau Township. Both noted that outcropping was scarce and mostly concentrated along ridges and hills adjacent to rivers and lakes. Report RP143(A) mentions a trench located on the north-western shore of Lac Chanceux (just west of our claim boundary) that measures 100 feet in length and cross-cuts lithological contacts. Rock outcropping 30 feet

to the south of the trench was mapped as Andesite with fine disseminated Pyrite. The trench intersected tuff and talc-schist with quartz veining and localized carbonization but returned no significant assay values.

The next reported works involved a massive airborne EM survey conducted by Shell Canada in 1977 (R.J. de Carle, 1977). Questor Surveys Ltd. Flew 1,524 line kilometers using a Trislander C-GOXZ at 400 feet with the bird at 150 feet and 200m line spacing. A follow-up was conducted in 1977 (Côté, 1977) where VLF and geological mapping was completed on all conductors identified from the airborne EM. From the maps, it appears that while claims from the Urban-Barry property were included, nothing of note was followed-up on.

The government of Quebec was the next entity to commission geophysical work over the area (Gobeil, 1983). In 1981, Questor Surveys Ltd. flew an EM survey over the Marin-Barry region, with data compiled by Les Relevés Géophysiques Inc. The data was transposed over aerial photographs taken in 1967 and 1971 at a 1:40,000 scale. The entire NTS sheet 32G03 was among the territory covered. The survey identified numerous anomalies east and west of Lac Chanceux and all along the Urban Deformation Zone.

For several years, a portion of the Urban-Barry claims were included in the Eagle River Property, a joint venture project between Les Ressources Oasis and Mines Masseguay Inc. They completed geophysical surveys in both 1987 (McCurdy, 1987) and 1988 (McCurdy, 1988) before doing follow-up work in 1989 (Richer, 1989) that included geological mapping and sampling.

The Ministère de l'Énergie et des Ressources conducted an aeromagnetic survey in 1988 (DV 88-06). The survey was flown at a height of 125m with a 200m line spacing. This survey covers all the Urban-Barry claims. In 1990, the MER commissioned a team to conduct geological mapping of the area around Lac Aux Loutres and Lac Lacroix, in the western end of the UBGB using helicopters and canoes. Their objectives were to define the lithostratigraphic units,

elaborate on the structural analyses and to investigate mineral showings (Joly, 1990). Their findings are in report MB 90-42.

The claims then became incorporated into Aur Resources' Belmont Property, which was the subject of a helicopter-borne Mag, EM and VLF-EM survey in 1997 with follow-up work completed later that year. An IP survey was completed on parts of the Belmont Property in 1998 (Plante, 1998), two lines of which fall of the current Lac Chanceux claims that make up the Urban-Barry property.

Murgor Resources then picked up the claims, conducting their own helicopter-borne EM survey in 2004. At this point the claims once again fell under the Eagle River Property. Several additional programs were conducted on the claims, including: Helicopter-borne VTEM in 2004, resistivity and IP surveys at Lac Chanceux in 2005, regional-scale prospecting in 2008 and horizontal loop EM that covers parts of the claims conducted by Murgor Resources.

It appears that from 2005-2006 until present, the Urban-Barry claims have not been part of any regional exploration efforts by any companies or individuals.

4. Regional Geology

Regional Geology taken from (McLaughlin et al., 2015) and (Rhéaume et Bandyayera, 2006):

The Urban Barry property lies within the Urban-Barry Greenstone Belt which is in the eastern part of the Abitibi sub-province. The greenstone belt has an east-west extent of roughly 135km and varies in width from 4 to 20km. It is bounded to the north by the Urban Deformation Zone, to the east by the Grenville Front, to the south by granitoid rocks of the Barry complex and to the west by the granitoid rocks of the Souart Pluton. The Urban Deformation Zone is a major east-trending Archean shear zone that separates the Urban-Barry Greenstone Belt from the

granitoid rocks of the Hébert and Father Plutons. The Grenville Front is a major Proterozoic discontinuity that truncates Archean rocks in a north-northeast direction.

The Urban-Barry Greenstone Belt (UBGB) is subdivided into five rock formations, interpreted to have formed between 2,791 and 2,707 Ma: The Urban, Macho, Fecteau, Lacroix and Chanceux. All five formations are imbricated and separated by thrust faults with oblique movement. The Fecteau Formation is the oldest in the Urban Barry Greenstone Belt. The Urban Formation is located at the base of the stratigraphy and consists of massive or pillowed Tholeiitic basalt, gabbro sills and felsic volcanic rock. The Macho Formation consists of massive or pillowed basalt units interbedded with felsic volcanic units. It also contains massive gabbro units and metasedimentary sequences composed of wacke, mudstone and conglomerate. Volcanic rocks of the Macho Formation, including rocks of the Windfall Member, are cut by a series of quartz and/or feldspar porphyry dykes. Samples taken from the Barry Gold Deposit dated these dykes at 2,697 ± 0.6 Ma. The contact between the Urban and Macho Formations is marked by the Milner Shear Zone in the western part of the UBGB, and by the southern limit of the Urban Deformation Zone in the eastern part of the UBGB. The Romeo Formation is composed of clastic metasedimentary rocks that locally contain metamorphic layering. It is located north of the Urban Formation, and its contact with the Urban Formation is marked by the northern limit of the Urban Deformation Zone. Rocks of the UBGB were deformed during the 2,710 to 2,660 Ma Kenoran orogeny. The regional foliation generally strikes northeast to east-northeast with a variable dip from 30 to 85° to the southeast. The regional foliation is associated with a stretching lineation that plunges steeply to moderately to the east. Associated regional folds are generally isoclinal with steeply plunging axes, although Bandyayera et al. (2002) interpreted a shallowly-plunging regional-scale syncline south of the Windfall Member (named Urban Syncline). A series of east-northeast-trending shear zones characterized by strongly developed foliation occur in the UBGB and include the Milner, Masères, Saint-Cyr and Barry Shear Zones. As you approach the Urban Deformation Zone (UDZ) in the northern part of the belt, stratigraphic contacts, regional foliation and spaced cleavage become re-oriented in a predominantly east-west direction, paralleling the UDZ.

A set of north-northeast-trending brittle faults associated with slickenlines that are moderately plunging to the northeast crosscut all other structures. Such faults are likely related to the Grenville Front and include the Thubière, Croft, Picquet, Father, Roméo and Windfall faults. Rocks of the UBGB are generally metamorphosed to greenschist facies, although near intrusions, conditions locally reached amphibolite assemblages. The regional metamorphic temperature-pressure gradient generally increases eastward towards the Grenville Front.

5. Property Geology

The limited amount of historical work completed on the Urban Barry claims, coupled with the lack of surface outcropping and deep overburden depths means the bulk of the interpreted property-scale geology has been derived from surface and sub-surface work completed on adjacent properties within the UBGB. The property-scale geology at Urban Barry consists of three main Formations (per the Quebec Government's website, SIGEOM): Urban, Macho and Chanceux. Structurally, the main property is cut by several regional-scale faults (Saint-Cyr, Milner and Rouleau) as well as a regional-scale shear zone: The Urban Deformation Zone. The Barry Fault cuts across the top North-West corner of the Lac Chanceux claim block before paralleling the claim boundary.

The rocks of the Chanceux Formation (2727 Ma) are associated with the first cycle of volcanism in the area that cover the basal Fecteau Formation (2791 Ma) (Rhéaume et Bandyayera, 2006). The Chanceux Formation rocks are interstratified intermediate to felsic volcanic rocks and epiclastic sedimentary rocks that characterise the end of the first volcanic cycle of the Urban-Barry. Rocks in this formation consist primarily of tholeiitic basalts, rhyodacitic or rhyolitic tuffs of calc-alkaline to transitional composition as thin beds with interstratified greywacke and graphitic argillites, intermediate tuffs and synvolcanic gabbros. The Chanceux Formation also includes the rocks bounded by the Barry, Milner and Saint-Cyr Faults, and are mainly composed

of greywackes (sometimes magnetite-rich), mudstones and tuffs. The greywackes are quite abundant between the Barry and Saint-Cyr Faults, as well as to the south of Lac Chanceux, and due to their chemical composition, very likely represent the results of the erosion of the Chanceux Formation volcanics.

The Macho Formation refers specifically to a group of predominantly mafic volcanic rocks bounded by the Milner and St-Cyr Faults. These rocks formed 2718 Ma during the UBGB's second cycle of volcanism and are divided into two distinct lithostratigraphic units: The Windfall Member and the Rouleau Member. The Macho Formation consists mainly of basalts, andesites and andesitic basalts of transitional island arc settings. It also contains minor amounts of tholeiitic seafloor basalts and synvolcanic gabbros.

The Urban Formation (2707 to 2714 Ma) is the largest of the formations belonging to the UBGB, extending for over 125km from Lac Wilson to Lac Roy (Rhéaume et Bandyayera, 2006). The bulk of the Urban Formation consists of tholeiitic basalts with minor amounts of synvolcanic gabbros, felsic volcanics and sediments. The Urban Formation is a sequence of young effusive rocks with two important felsic centers within the formation: the Novellet Member (2714 Ma) and the Freeman Member (2707 Ma). The Urban Formation represents the third, and last, cycle of volcanism for the UBGB.

Property-scale geology and structures, as per the SIGEOM interactive website, can be found in Figure 3.

6. 2016 Exploration

In early 2016, Exploration Facilitation Unlimited Inc. was asked to complete a compilation of all data related to the Urban Barry and Lac Chanceux claims, including data from adjacent properties with known mineralization. Based on interpretations and previous works, EFU was

then to recommend an exploration program that would properly assess the potential of the Urban Barry property. Based on the available data from a variety of sources, including government websites, a four-week program consisting of ground geophysics, prospecting and soil sampling was proposed. A quick one-day reconnaissance trip was conducted by J. Rensby of EFU on February 18th, 2016 to assess access and ground conditions. It was determined that access to the western portion of the main claim block could not be done from the main highway due to poor access, and all recommendations for work were based on time necessary to travel from the eastern portion of the main block, especially where the Lac Chanceux claims were concerned. Satellite imagery was used to attempt to determine where historic logging roads could still exist, not only providing access but also possible locations for visible soil profiles and outcropping. The main challenge for accessing the eastern portion of the main claim block as well as the Lac Chanceux claims is the Saint-Cyr River, which cuts the main claim block in two from SE to NW. Ground truthing showed that no dry crossing existed within, or in proximity to, the claims, so a raft was constructed to ferry people and equipment across the river at its narrowest point on the property. Between May 16th and June 15th 2016, 57.6 line kilometers of VLF-EM/Mag, 89.3 line km of Beep Mat, 244 soil samples, 2 grab samples and 15 small-diameter diamond drill holes were completed. A second soil sampling program was completed between August 10th and 17th 2016 when an additional 282 samples were collected.

6.1 Geophysics

As evidenced by the list of historical works conducted on various sections of the property, a fair amount of ground and airborne geophysics have been completed over the years. The Aeromag survey flown by the government in the late 1980's can be accessed on the Ministère de l'Énergie et des Ressources Naturelles' interactive SIGEOM page (www.sigeom.mines.gouv.qc.ca). The Aeromag data shows several interesting features, the most obvious of which is the wide, anomalous mag zone that parallels the entire length of the Urban Deformation Zone/Milner Fault that cuts across the center of the main claim block.

There are also anomalous mag zones stretching across the bottom of the main claim block as well as within two of the three Lac Chanceux claims. In addition, There is an anomalous mag zone stretching between the Milner and Rouleau Faults that potentially represents a zone of dilation. Other than two lines of IP completed on the Lac Chanceux claims, no ground-based geophysics have been completed on the property. Ground-based geophysics can be a very cost-effective means of first pass exploration, especially in areas of poor outcropping and deep overburden such as the Urban Barry. With that in mind, a geophysics program was recommended, utilizing both VLF-EM in conjunction with MAG as well as Beep Mat. From May 16th to June 15th, crews completed 89.3 line km of Beep Mat grid and 57.6 line kilometers of Mag and VLF-EM.

6.1.1 VLF-EM

As previously stated, overburden thicknesses on the property vary from 0m to 60m with, on average, 25m of cover and less than 5% outcrop exposure throughout the claims. Due to the thick overburden and general lack of bedrock exposure on the property it was determined that VLF-EM would be an excellent tool to assist with mapping stratigraphy, structure and potential mineralization, particularly when run in conjunction with the ground mag survey. Since the Urban Deformation Zone (UDZ) runs East – West and all other structures run SW – NE, VLF-EM and Mag surveys were completed from North to South at 200m line spacing and 12.5m in between stations with VLF-EM readings taken immediately after the magnetic readings. In total, 57.6 line kilometers of VLF-EM were completed using a GSM-19V Overhauser magnetometer, built by GEM of Toronto, Canada. The GSM-19 Overhauser is essentially a proton magnetometer, but the Overhauser effect increases its sensitivity to 0.01 nanoTesla and its precision to 0.1 nT. The VLF-EM module can simultaneously measure the signal from three stations. With three orthogonal sensors, the vertical in-phase and out-of-phase components are measured as % of the total field; the total field is measured in picoTesla and horizontal field component in arbitrary scale. The VLF station NAA 24.0 kHz, located in Cutler, Maine provided the signal for the measurements. The VLF-EM data was sent to MBGeosolutions, where Jean

Hubert, a geophysicist professionally registered in the Province of Québec, analyzed the data as required by law. The processed data indicated two different domains (likely differentiating between more mafic and more felsic units) as well as four electromagnetic anomalies, one of which coincides with a magnetic anomaly. The location of the VLF-EM and Mag transects can be found in Figure 4 while the interpreted anomalies can be found in Figure 5. The complete set of results of this analysis and the accompanying report from MBGeosolutions can be found in Appendix C.

6.1.2 Beep Mat

Beep Mat surveys are considered a cost-efficient means of identifying near-surface EM anomalies. One major limitation to the Beep Mat survey is the depth to which it is effective. Even though it generally penetrates no further than 3m, it is nonetheless a very important tool in preliminary exploration efforts. The Beep Mat is mounted on a small sled that is then pulled behind a person/ATV/snowmobile during the surveying process while a built-in GPS monitors position. The sled-like design of the unit can cause issues when surveying in the warmer months as the apparatus can easily get caught in thick ground cover or brush. The survey detects the magnetic susceptibility and relative EM conductivity of the underlying substrate to a maximum depth of approximately 3m (10 feet). The response of the machine to a conductor it passes over is instantaneous and proportional to the strength of the conductor, meaning one can immediately follow up on, and quickly define, an anomalous region without having to strictly adhere to planned survey lines.

The proposed Beep Mat survey was initially planned to cover all the claims at 200m line spacing in both N-S and E-W directions. Line spacing was tightened to 100m in areas with previously identified aeromagnetic anomalies for a planned total of 203km of Beep Mat. Unfortunately, due to time constraints, a large portion of the planned Beep Mat survey lines were not completed. However, data was collected in targeted areas, notably along the UDZ and across known Aeromag anomalies. In total, 89.3 line km of Beep Mat were completed, with survey

locations and results available in Figure 6. Location of survey lines was tracked using handheld GPS units in addition to the units built into the Beep Mat tools.

Over the course of the Beep Mat survey, sixty-one (61) locations returned anomalous HFR, LFR and/or Mag readings, most of which were boulders representing point anomalies rather than broader anomalous zones. Several of these Beep Mat anomalies were subsequently investigated using the Shaw backpack drills, and these results can be found discussed below in section 6.3.

6.2 Soil Sampling

Soil sampling is often viewed as a cost-effective manner of quickly finding metal-in-soil anomalies. Contouring of these anomalies can then be compared to geophysical anomalies as a means of identifying potential targets. In an area with very little topographic relief and few outcrops, contouring of soil anomalies could be a valuable key in discovering potential new deposits.

Soil sampling at Urban Barry was completed in two programs: An initial program with a 200x200m grid and a follow-up program to tighten spacing in areas with numerous anomalous results. The first phase of sampling was completed between May 16th and June 16th 2016, while the second phase of sampling was completed between August 10th and 17th 2016.

May – June 2016

The preliminary soil sampling program proposed for the Urban Barry property consisted of a 200m x 200m grid for a total of 325 planned samples covering the entire main claim block as well as all three Lac Chanceux claims. In total, field crews collected 244 soil samples at depths ranging from 0.15m to 3.09m with an average of 0.80m. The samples were collected from

sections of the main claim block and a small section of the westernmost Lac Chanceux claim. A GPS location and sample depth was recorded for each individual sample as well as a brief description of the sampled soil horizon. The bulk of the samples were collected from layers of sand of varying coarseness with silt and pebbles or cobbles. The depth to soil determined the which method was used for sample collection; shallower samples were collected using a stainless-steel soil auger and stainless steel tools to avoid contamination while deeper samples covered with thick moss were collected using the Shaw backpack drills. The backpack drills use stainless steel parts as well as plastic sample tubes to collect the soils in-situ and maintain the integrity of the sample while avoiding contamination. Numerous samples from the proposed grid were not collected due to thick moss cover in swamps. Tight time constraints as well as difficult access resulted in the bulk of the Lac Chanceux claims being skipped during the sampling process as well. Once collected, samples were dried and shipped to ALS Laboratories in Val d'Or for analysis. See Figure 7 for the sample locations and best results from the May-June sampling program.

August 2016

The results of the first phase of soil sampling completed in May and June of 2016 identified several areas of interest with anomalous values of either Au, Ag or Cu. The north-west corner of the main claim block returned numerous anomalous Ag assays while several samples in the center of the main claim block adjacent to the Saint-Cyr River returned anomalous Au values. Due to the wide sample spacing, grade contouring was difficult and imprecise. For this reason, a second soil sampling program was planned and executed in August 2016. In the second program, line and sample spacing was tightened to 25-50m with a total of 282 additional samples collected. The additional samples on the Ag grid were taken at 50m intervals and the additional samples for the Au grid were taken at 25-50m intervals. These samples were collected using the Shaw backpack drills. Sampling on the smaller grids (Au, Ag and Cu) throughout the claim block were also on 25-50m spacing and were collected using soil augers. Samples were collected from silty sand horizons at depths ranging from 0.15m to 4.00m and an

average of 1.10m. Figures 8, 9 and 10 show the sample locations and best results for the in-fill soil sampling program completed in August. Figures 11, 12 and 13 show the results of the soil sampling programs with grade contouring for Au (Figure 11), Ag (Figure 12) and Cu (Figure 13). See section 7 for discussion of analysis and results.

The method used to contour the soil assay data (*n*=537) in ArcGIS Spatial Analyst was inverse distance weighted (IDW) interpolation. With this method, the interpolation algorithm estimates cell values by weighting sample data points in the neighborhood of each processing cell. IDW uses the assumption that each measured point has a local influence that diminishes with distance. The following IDW parameters were used to generate the contour maps:

1. Output cell size = 5m
2. Search radius = Variable
3. Search radius number of points = 12

Soil sample contour rasters were then classified into nine classes using the Jenks' Natural Breaks algorithm. Natural breaks classification is a cartographic data classification method that partitions data into classes based on natural groups in the data distribution. This method aims to reduce the variance within classes and maximize variance between classes.

6.3 Diamond Drilling

During the initial May – June 2016 exploration program, small-diameter diamond drilling was completed using a Shaw backpack drill producing 25mm diameter core. The backpack drill is a great tool for investigating shallow anomalies as it is very cost- and time-effective. The drilling was used to follow up on Beep Mat conductors with elevated HFR and MAG values. Since Beep Mat conductors are within 3m of surface, and backpack drills can reliably drill to 8-10m depth, the drills were an efficient way of immediately verifying conductors and magnetic anomalies. All drill holes were logged, geoteched, photographed and sampled by geologists in the field. A map showing drill hole locations and assay values of note can be found in Figure 14.

A total of Fifteen (15) drill holes were completed for 12.92m of drilling consisting of 0.38m of overburden and 12.54m of bedrock. Drill hole locations can be found in Figure 14 in Appendix A. Eleven (11) of the holes were drilled into suspected boulders and subsequently stopped when the holes intersected soil. Three (3) of the holes were drilled into bedrock and stopped when the intensity of the fabric, alteration or mineralization of interest disappeared. One hole, UB16-011, was drilled in two parts, UB16-011 and UB16-011a, but sampled as one single hole. In total, sixteen (16) samples were collected and sent to ALS Laboratories in Val d'Or for analysis. The results of these samples are discussed below in section 7 and available in Appendix B.

Four (4) of the drill holes intersected boulders of chert-rich iron formation with up to 10% Pyrite, minor Chalcopyrite and trace disseminated Magnetite. Three (3) holes intersected boulders of granodiorite with trace amounts of disseminated Magnetite and fine grained Pyrite along vein margins. Holes also intercepted boulders of Quartz veining (1), Syenite (1) and Mafic Volcanic (1). Two (2) of the three holes drilled into outcropping, UB16-013 and UB16-014 intersected fine grained basalts with varying amounts of fine grained disseminated Pyrite and fine to medium grained disseminated Magnetite. The basalts were massive to vesicular with chloritic alteration and quartz-ankerite stringers. The third hole drilled into outcropping, UB16-012, intersected Phyllite with 3% quartz veining and 2% Pyrite. The final hole intersected a variety of boulders of varying lithologies that were sampled together. The drill hole locations and their respective results can be found in Figure 14 in Appendix 1.

6.4 Field Mapping and Sampling

In order to maximize productivity while in the field, crews completing geophysical surveys also spent time noting outcrop locations and taking structural measurements where possible. Over the course of the four-week program, two (2) grab samples were collected and seventy (70)

potential outcrop locations were noted (although the majority were indicated as being subcrop or boulders). Grab samples were collected using rock hammers and inserted into plastic bags with sample tags. Data was recorded into a sample book or note book while in the field, then subsequently entered into a master spreadsheet at the end of the day. The location of the two grab samples and their results can be found in Figure 14. Field mapping was also included within the scope of the program, however only a small portion of the westernmost Lac Chanceux claim was mapped (see Figure 15).

7. Analysis, Results and Discussion

Sample locations and notable results for the soils, drill core and grab samples collected during both exploration programs can be found in Figures 7 to 14 in Appendix A. All samples collected were submitted to ALS Labs in Val d'Or Quebec for analysis. The lab certificates with the associated results can be found in Appendix B. All samples were collected, bagged and tagged by EFU employees in the field. Samples were placed in clear plastic bags with the sample number written on the outside of the bag. A paper tag was then inserted in the bag before sealing the bag with a zip tie. Soil samples were placed in paper sample bags instead of plastic bags. All bags were triple checked for correct ID numbers before leaving site and were delivered by EFU employees to the lab in person. No standards, blanks or duplicates were inserted into the sample stream by EFU. QA/QC for these samples relied on internal QA/QC protocols for ALS Labs. The samples were sent in 4 batches, 3 for the soils, grabs and drill core samples in May/June and 1 batch for the soils collected in August.

7.1 Sample Analysis – Soils

The soil samples collected at Urban Barry were dried before being submitted to ALS Laboratories in Val d'Or for analysis. 244 soil samples were submitted to ALS on June 13th 2016 in two batches and 295 soil samples were submitted to ALS on August 19th 2016 in one batch. It

should be noted that the analysis method for the samples submitted in August was altered to include Au analysis using Fire Assay and Atomic Absorption for increased accuracy and consistency of results.

June Submission

The soil samples were submitted in two batches: the first containing 123 samples and the second containing 121. Preparation involved screening of the sample to -180µm followed by ME-MS41L analysis, which combines Aqua Regia digestion and analysis by ICP-MS and ICP-AES to provide extremely low detection limits for: Au, Ag, Al, As, B, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, Hg, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Pd, Pt, Rb, Re, S, Sb, Se, Sn, Se, Ta, Te, th, Ti, Tl, U, V, W, Y, Zn and Zr. It should be noted, however, that Au values are semi-quantitative due to the small sample size used during analysis (0.5g). Sample preparation was completed at the ALS labs in Thunder Bay, while the ICP-MS analysis was completed in North Vancouver. As mentioned previously, EFU did not insert any standards, duplicates or blanks in the sample stream. During the analysis of the two hundred forty-four (244) soils, ALS inserted a total of twelve (12) standards, eight (8) blanks and analyzed eight (8) duplicates for QA/QC purposes.

August Submission

Following the second soil sampling program at Urban Barry, an additional two hundred eighty-two (282) samples were submitted to ALS for analysis. During sample submission, an additional thirteen (13) sample numbers - for samples not collected during the program - were erroneously submitted to the lab, explaining why the lab certificates state 295 samples were submitted. Also, due to the semi-quantitative nature of the Au results associated with the analysis package used previously, it was decided to add Au analysis using a FA AA finish on 50g samples to get accurate Au values. Here, samples were once again screened to -180µm. A 50g sample was then analyzed by fire assay with an AAS finish. Additional multi-element analysis

was then completed on a sample (minimum 1g) using aqua regia digestion combined with ICP-AES analysis for: Ag, Al, As, B, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Ga, Hg, K, La, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sr, Th, Ti, Tl, U, V, W and Zn. Preparation of all samples submitted in August was completed at the ALS labs in Sudbury, Ontario with analysis completed in North Vancouver, BC. The lab inserted a total of seventeen (17) standards, nine (9) blanks and analyzed twenty (20) duplicates for the Au FA AA samples and twenty-six (26) standards, fourteen (14) blanks and analyzed fifteen (15) duplicates for the ICP-AES samples for QA/QC purposes.

7.2 Sample Analysis – Drill Core

Sixteen (16) drill core samples and two (2) grab samples were submitted to ALS labs in Val d'Or for analysis on June 13th 2016. Here, samples were crushed to 70% passing <2mm before being split with a riffle splitter. The split was then pulverized to 85% passing <75µm before analysis. The analysis methods used on the core samples are the same as the methods used on the soils submitted in August 2016. 50g samples were analyzed for Au by fire assay with an AAS finish in addition to the multi-element aqua regia ICP-AES analysis. Two (2) standards, one (1) blank and three (3) duplicates were added to the Au sample stream while four (4) standards, two (2) blanks and two (2) duplicates were added to the ICP-AES sample stream for QA/QC purposes. Sample preparation was completed at the ALS laboratories in Thunder Bay, ON while analysis was completed in North Vancouver, BC.

7.3 Discussion of Results

The results of the VLF-EM survey were processed and interpreted by a geophysicist registered in the Province of Québec, as required by law. The results and interpretations can be found in Appendix C. Several VLF anomalies were identified from the data while the mag data identified two lithological domains as well as what are likely gabbroic intrusions. The VLF anomalies appear to be concentrated in the southern domain composed of intermediate to felsic rocks.

These anomalies require follow-up and confirmation using an alternative electromagnetic method, such as MaxMin or induced polarization. The geophysical data also appears to show the intersection of the Rouleau and Milner faults occurs within the UB claims as opposed to east of the claims as indicated by the government maps on SIGEOM.

Sixty-one (61) locations returned anomalous HFR, LFR and/or MAG values over the course of the Beep Mat survey. The majority of these locations were subsequently identified as boulders with point rather than broad-scale/continuous anomalies. Of the sixty-one locations, follow-up drilling was completed on fourteen (14) anomalies using the Shaw backpack drills. Eleven (11) of the holes were drilled into boulders of iron formation or rocks containing varying levels of disseminated sulfides or magnetite. Three (3) holes were drilled into outcrop or subcrop of rocks containing disseminated magnetite or sulfides. All the core from the follow-up drilling was sent for analysis, with results returning low values that, at the present time, do not warrant further investigation.

By far, the most interesting and promising results were the assays from the soil sampling program. The tighter line and sample spacing from the second soil sampling program completed in August permitted the use of various methods to complete grade contouring. It was already quite apparent from the initial soil sampling program that there were broad-scale areas of anomalous Au, Ag and Cu. Initial results had Au values ranging from trace to 0.127 g/t and trace to 62 g/t Ag including eighteen (18) soil samples returning assays greater than 10 g/t Ag. When silver's relative immobility is taken into consideration, these values suggest that the source of the mineralization could be quite close. With the larger sample population, these zones became even more apparent. From the resulting maps, we can see that while the anomalous zones for Ag and Cu are immediately adjacent to – and paralleling – the Urban Deformation Zone in the north-west corner of the main claim block, the anomalous Au zones appear to follow both the UDZ (and associated Milner Fault) and the Rouleau Fault. These anomalous Au zones appear to intersect within the claim boundaries, which would further support the Milner and Rouleau Faults intersecting on the property as indicated by the

geophysics. It should also be noted that the anomalous gold zone associated with the Rouleau Fault is a mere 500m from the Saint-Cyr Fault, the structure that hosts Bonterra Resources' Gladiator Zone. The soils also indicated a zone of base metal enrichment, with values ranging from trace amounts up to: 109ppm Ni, 268ppm Cu, 238ppm Cr and 614ppm Co.

While the geophysical data appears to indicate electromagnetic and magnetic anomalies in the southern half of the UB property, the metal-in-soils data seems to indicate potential structurally controlled mineralization within the northern half of the claim block. That said, with so little rock outcropping on the property, it would be economical to utilize an alternative geophysical method such as IP to investigate the source (or sources) of the soil anomalies before stepping up something much costlier such as larger diameter diamond drilling. While it is clear that the numerous large-scale shear and fault systems cross-cutting the property served as pathways for fluid migration, it is not clear whether these structures also host any potential mineralization.

9.0 STATEMENT OF QUALIFICATIONS

I, Abby Peterson, P.Geo. do hereby certify that:

1. I am an employee of Exploration Facilitation Unlimited Inc. with my office based at 171 David Street, Chelmsford, Ontario, P0M 1L0.

2. I am a graduate of McGill University, Montréal, in the Province of Québec, with a Bachelor of Science degree in Earth and Planetary Sciences.

3. I am registered as a Professional Geoscientist (P. Geo./Géo) in the Province of Québec with the Ordre des Géologues du Québec (OGQ No.1463).

4. I have practiced my profession as an exploration geologist in the mineral exploration industry continuously since 2005. I have worked on gold and base metal exploration projects as a geologist in Ontario, Nunavut, the Yukon Territory, Québec (including Val d'Or) and in Burkina Faso, West Africa.

5. This report is for Assessment purposes and is not intended to be a NI 43-101 compliant report; nevertheless, it has been prepared with care.

6. I am responsible for the preparation of all sections of this report except for the Expenditures, which was prepared by EFU Inc. management.

7. I visited the Urban Barry Property personally between June 10th and June 12th, 2016. During this time, I visited the field, logged drill core and discussed the Beep Mat and VLF-EM surveys. I also went through the core drilling, logging and sampling procedures with all geologists involved.

Abby Peterson

CERTIFICATE VO16093491

Project: URBAN BARRY

This report is for 18 Drill Core samples submitted to our lab in Val d'Or, QC, Canada on 13- JUN- 2016.

The following have access to data associated with this certificate:

REZA MOHAMMED

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
CRU- 31	Fine crushing - 70% < 2mm
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au- AA24	Au 50g FA AA finish	AAS
ME- ICP41	35 Element Aqua Regia ICP- AES	ICP- AES

To: CANEXPLOR MANAGEMENT LTD
ATTN: REZA MOHAMMED
222- 515 WEST PENDER STREET
VANCOUVER BC V6B 6H5

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VO16093497

Project: URBAN BARRY

This report is for 123 Soil samples submitted to our lab in Val d'Or, QC, Canada on 13- JUN- 2016.

The following have access to data associated with this certificate:

REZA MOHAMMED

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
SCR- 41	Screen to - 180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION
ME- MS41L	Super Trace Lowest DL AR by ICP- MS

To: CANEXPLOR MANAGEMENT LTD
ATTN: REZA MOHAMMED

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).
ME- MS41L

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Thunder Bay located at 1160 Commerce Street, Thunder Bay, ON, Canada.
LOG- 22 SCR- 41 WEI- 21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

CERTIFICATE VO16093501

Project: URBAN BARRY

This report is for 121 Soil samples submitted to our lab in Val d'Or, QC, Canada on 13- JUN- 2016.

The following have access to data associated with this certificate:

REZA MOHAMMED

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
SCR- 41	Screen to - 180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION
ME- MS41L	Super Trace Lowest DL AR by ICP- MS

To: CANEXPLOR MANAGEMENT LTD
ATTN: REZA MOHAMMED
222- 515 WEST PENDER STREET
VANCOUVER BC V6B 6H5

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

NSS is non- sufficient sample.
Applies to Method: ALL METHODS

LABORATORY ADDRESSES

Processed at ALS Sudbury located at 1351- B Kelly Lake Road, Unit #1, Sudbury, ON, Canada.
Applies to Method: LOG- 22 SCR- 41 WEI- 21

Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.
Applies to Method: Au- AA24

Diamond Drill Hole Logs

Summary Logs and Samples

UB16-001

TARGET:	Beepmat anomaly				
HOLE NUMBER:	**UB16-001**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**469067mE**	**5438679mN**	WGS 84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	0.81m
BEARING / DIP	0/-90				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	Alex S.			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-0.81m: Pyroxene-rich banded iron formation, trace Chalcopyrite, 5-10% Pyrite, strongly fractured at top with fractures dissipating with depth.
Suspected boulder, hole stopped when soil encountered in drilling at 0.81m.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-001	20151	0.00	0.81	0.81

UB16-002

TARGET:	Beepmat anomaly				
HOLE NUMBER:	**UB16-002**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**468068mE**	**5438580mN**	WGS 84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	0.66m
BEARING / DIP	0/-90				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	A. Salminaw			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-0.66m: Pyroxene-rich banded iron formation, 0.1% Chalcopyrite, 10-15% Pyrite, strongly fractured at top with fractures dissipating with depth. Pervasive chloritic alteration.
Suspected boulder, hole stopped when soil encountered in drilling at 0.66m.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-002	20152	0.00	0.66	0.66

TARGET:	Beepmat anomaly				
HOLE NUMBER:	**UB16-003**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**468066mE**	**5438581**	NAD 83	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	0.41m
BEARING / DIP	0/-90				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	J. Rensby			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-0.41m: Pyroxene-poor banded iron formation, 5% Chalcopyrite, 10% disseminated Pyrite, Chlorite alteration haloes up to 1cm thick at fractures. 5% magnetite.
Suspected boulder, hole stopped when soil encountered in drilling at 0.41m.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-003	20153	0.00	0.41	0.41

UB16-004

TARGET:	Mag high Beepmat				
HOLE NUMBER:	**UB16-004**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**468066mE**	**5438580xmN**	WGS 84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	0.50m
BEARING / DIP	**0/-90**				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	A. Salminaw			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-0.38m: Overburden/soil.
0.38-0.50m: Medium grained quartz veining, moderate to high strain visible through elongated crystals. Minor pyroxene. Suspected boulder, hole stopped when soil encountered in drilling at 0.50m.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-004	20154	0.38	0.50	0.12

UB16-005

TARGET:	Beepmat anomaly				
HOLE NUMBER:	**UB16-005**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**468067mE**	**5438581mN**	NAD 83	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	0.73m
BEARING / DIP	0/-90				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	A. Salminaw			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-0.73m: Quartz-rich BIF with laminar chloritic alteration zones. <5% disseminated Pyrite and 3% disseminated Magnetite in quartz-poor and chlorite-rich intervals.
Suspected boulder, hole stopped when soil encountered in drilling at 0.73m.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-005	20155	0.00	0.73	0.73

UB16-006

TARGET:	Beepmat mag high				
HOLE NUMBER:	**UB16-006**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**468431mE**	**5438225mN**	WGS 84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	0.22m
BEARING / DIP	**0/-90**				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	J. Rensby			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-0.22m: Coarse-grained Syenite grading to diorite with depth, trace Pyrite, 5% disseminated Magnetite. Suspected boulder, hole stopped when soil encountered in drilling at 0.22m.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-006	20165	0.00	0.22	0.22

UB16-007

TARGET:	Beepmat mag anomaly				
HOLE NUMBER:	**UB16-007**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**469194mE**	**5438403mN**	WGS84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	0.78m
BEARING / DIP	**0/-90**				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	C. Reimer			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-0.78m: Granodiorite, competent with one single quartz vein. Chlorite alteration, 2% disseminated Magnetite, 1% Pyrite. Suspected boulder, hole stopped when soil encountered in drilling at 0.78m.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-007	20156	0.00	0.78	0.78

UB16-008

TARGET:	Beepmat mag anomaly				
HOLE NUMBER:	**UB16-008**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**467796mE**	**5436989mN**	WGS 84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	0.47m
BEARING / DIP	**0/-90**				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	C. Reimer			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-0.47m: Weakly magnetic Granodiorite with minor quartz veining and Chlorite alteration, 2% disseminated Magnetite. Suspected boulder, hole stopped when soil encountered in drilling at 0.47m.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-008	20159	0.00	0.47	0.47

TARGET:	Beepmat mag anomaly				
HOLE NUMBER:	**UB16-009**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**468803mE**	**5438333mN**	WGS 84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	1.43m
BEARING / DIP	0/-90				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	C. Reimer			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-1.43m: Granodiorite cut by numerous quartz veins and veinlets with 2% Pyrite associated with veining. Increase in K-feldspar from 0.66-0.95m.
Suspected boulder, hole stopped when soil encountered in drilling at 1.43m.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-009	20157	0.00	1.43	1.43

UB16-010

TARGET:	HFR response on Beepmat				
HOLE NUMBER:	**UB16-010**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**467809mE**	**5436404mN**	WGS 84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	1.83m
BEARING / DIP	0/-90				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	A. Salminaw			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-1.83m: Overburden. Mix of boulders of varying lithologies (not recorded).

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-010	20158	0.00	1.83	1.83

UB16-011/011A

TARGET:	Beepmat mag anomaly				
HOLE NUMBER:	**UB16-011/011a**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**469396mE**	**5438114mN**	WGS84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	0.34m
BEARING / DIP	**0/-90**				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	C. Reimer			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-0.34m: Mafic volcanics, pervasive chlorite alteration, cut by numerous quartz veinlets, boulder.
Hole drilled in two parts, 0.18m in UB16-011 and 0.16m in UB16-011a. Hole stopped when soil encountered.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-011/011a	20160	0.00	0.34	0.34

TARGET:	Beepmat mag anomaly in O/C				
HOLE NUMBER:	**UB16-012**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**469784mE**	**5433999mN**	WGS 84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	2.48m
BEARING / DIP	**0/-90**				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	C. Reimer			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-2.48m: Strongly foliated phyllite with sericitic alteration, strong chloritic alteration and 2% disseminated Pyrite. Clay seam at 0.50m with chloritic alteration halo. Quartz-veining becomes more abundant with depth to 1.45m, as does vein-associated Pyrite. Below 1.45m, foliation decreases but veining with Pyrite mineralization continues.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-012	20163	0.00	2.48	2.48

UB16-013

TARGET:	Conductor on Lac Chanceux claim identified during beepmat survey				
HOLE NUMBER:	**UB16-013**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	469719	5434019	WGS 84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	2.50m
BEARING / DIP	0/-90				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	A. Peterson			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-1.00m: Basalt/mafic volcanic with 0.1% disseminated Magnetite often concentrated at vein margins and 0.5% disseminated Pyrite. Weak pervasive chlorite alteration throughout. 10% quartz veining at top, decreases with depth.
1.00-1.50m: Moderately magnetic basalt/mafic volcanics with 7% disseminated Magnetite, 3-5% quartz stringers and trace disseminated Pyrite.
1.50-2.50m: Amygdular basalt, weakly silicified, 1-2% quartz stringers, 2% Pyrite. Non magnetic.
Hole stopped when magnetite disappeared and veining abundance decreased.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-013	20101	0.00	1.00	1.00
UB16-013	20102	1.00	1.50	0.50
UB16-013	20103	1.50	2.50	1.00

UB16-014

TARGET:	Outcrop Beepmat magnetic anomaly				
HOLE NUMBER:	**UB16-014**				
GRID LOCATION:				CLAIM NUMBER:	
SURVEY LOCATION (UTM):	**469773mE**	**5434002mN**	WGS 84	ELEVATION:	
CORE SIZE:	AQ			LENGTH:	0.53m
BEARING / DIP	0/-90				
START:				FINISH:	
DRILLING CONTRACTOR:	Grizzly			DRILL:	Shaw Core Drill
LOGGED BY:	C. Reimer			LOG COMPLETED:	

SUMMARY - LITHOLOGY

0.00-0.53m: Fine grained basalt with 1% fine disseminated Magnetite and 1% disseminated Pyrite, minor veining. This drillhole was drilled on the final day of the project and was stopped when time ran out.

SUMMARY - SAMPLING

Drillhole ID	Sample ID	Depth From	Depth To	Width
UB16-014	20164	0.00	0.53	0.53
