1. Introduction

The following report discusses the exploration activities carried out on the Urban Barry and Lac Chanceux claims (Urban Barry Property), their results and associated recommendations. These activities were completed by Exploration Facilitation Unlimited Inc. ("EFU") on behalf of Vorenus Metal Corp. ("Vorenus") in June and July of 2017.

The Urban Barry Property is located approximately 120km east of the town of Lebel-sur-Quévillon which is in turn approximately 650km north of Montreal and 260km north east of Val-d'Or QC. The Property consists of two claim blocks: the main Urban-Barry claim block consisting of twenty (20) claims and three (3) additional claims on Lac Chanceux, approximately 6km south of the main block. The claims are centered on 5,437,088mN and 468,237mE (zone 18T) and are located on NTS sheet 32G03. The Urban Barry property falls under the municipality of Eeyou-Istchee James Bay and as such, is subject to the various agreements associated with this municipality.

In the spring of 2017 EFU was tasked with reviewing all of the available data for the Urban Barry property including that collected by EFU in the spring and summer of 2016. Previous exploration activities in the area had been limited and the currently available data was strongly weighted by the soils collected and the mag survey conducted in 2016. Several known structures cross the property including the large-scale Urban Deformation Zone-- which cuts across the center of the main claim block in a roughly E-W direction. The geophysical data collected in 2016 also indicated that there is a major fault that intersects the Deformation Zone on Aldever's claims. With this in mind, top priority was given to patterns in soil sample anomalies that paralleled structural anomalies. Very little attention was given to possible EM

conductors identified by the 2016 VLF-EM survey as the EM data, as collected, was rife with possible issues. From June 5th to July 8th, 2017 EFU crews followed up on the initial data by conducting six line-km of IP grid survey and overseeing 1,372 meters of diamond drilling conducted by Forages Rouillier of Amos, Quebec.

2. Geographical Setting

2.1 Location, Access and Infrastructure

The Urban-Barry Project is located mid-way between the Val-d'Or and Chibougamau mining camps. The main claim block falls within Belmont Township, while the nearby Lac Chanceux claim block is in Lacroix Township. The entire property can be located on National Topographic System (NTS) sheet 32G03 with a central reference point located at 49.085827° latitude and -75.435010° longitude and 5,437,088mN; 468,237mE UTM NAD 83 Zone 18T. Figure 1 shows the location of the claims on a small regional scale while figure 2 shows the claims on a larger local scale with township lines and roads as references.

The Urban Barry property is in Northwestern Quebec, approximately 675km NNE of the city of Montreal, 275km north-east of Val d'Or and 120km east of Lebel-sur-Quévillon. The property is accessed via a series of maintained and unmaintained gravel logging/mining roads starting at the small city of Lebel-sur-Quévillon. The main claim block at Urban Barry is composed of twenty (20) contiguous claims totaling 1127.44 hectares with an additional 169.23 hectares covering three (3) claims at Lac Chanceux.

The main property block can be accessed year-round by truck, ATV/snowmobile and foot. Lebel-sur-Quévillon lies within 4km of highway 113; approximately 124km north of the Transcanadian highway linking Montreal to Val-d'Or (highway 117). From Lebel-sur-Quévillon, the property is accessed by driving 11km on the very well-maintained road out of Lebel (#1000), then driving 56km on the 5000 road before turning onto the 6000 road. From this point it is approximately 46km on the 6000 road before turning onto an unmaintained logging main road last used for logging in 2015. This turn is made about 3km from Osisko Mining's Lac Windfall

Camp. The claim boundary is 29km further on this unmaintained logging road via two separate routes with the split in routes at a beaver dam 2km from the claims. On the western one of these two access routes to the property is where EFU built their base camp for the duration of the exploration activities. The camp consisted of a mess/dining tent, a dry tent, a core shack/ office, and 2 x 4-man sleeping tents. During the IP survey some individuals slept in personal sized tents. All work was conducted on the western side of the claims as the Saint-Cyr River bisects the main claim block.

Access to the east side of the main claim block can be gained from Chibougamau or Chapais, however once off the main highway, forestry roads are long unused, ill-maintained, and impassable without using a chainsaw to cut a route in through blown down trees and overgrown roads. In the summer of 2016, a raft was constructed to capably carry people and ATVs safely across the Saint-Cyr from the west side. This allowed crews to work on the eastern portion of the claim block and access the Lac Chanceux claims. This access was not used or needed in 2017.

From Val-d'Or it is an approximately 4-hour drive to the Urban Barry base camp. In turn, Val-d'Or is a 6-hour drive (or a 75-minute flight) from Montreal, 526km to the south-east. Air Canada offers daily service between Montreal and Val-d'Or using its fleet of Dash-8 aircraft. Val-d'Or is a well-serviced city with a population of approximately 32,000 people and amenities that include numerous hotels and restaurants as well as equipment manufacturers and rental companies. Groceries, equipment and supplies can be purchased at any number of stores in Val d'Or-- it is a good place to augment groceries and supplies before driving on to Urban Barry. Lebel-sur-Quévillon also has several restaurants in addition to grocery and supply stores, however the town is much smaller often leaving limited selections to choose from. The town does however provide an excellent place to pick up small orders in between larger orders and to access communications when needed. It also offers a bus terminal and trucking companies for moving people and supplies. The Urban-Barry base camp falls outside cell phone range making daily communications for safety check-ins and ordering supplies sometimes challenging. A satellite phone or portable

satellite dish is the only means of communication while on site and call quality was often poor, particularly during inclement weather. Cell phone coverage is available within 20km of the town of Lebel-sur-Quévillon.

Due to a good portion of the property being flat and swampy, fieldwork in this area is best completed in winter while the ground is frozen. The rest of the property can be accessed and explored year-round on foot with access by foot or ATV via logging roads. There is a network of historic logging roads throughout the claims—most of the logging having been conducted in the 1990's.

2.2 Climate, Topography and Vegetation

The Urban-Barry region experiences a continental to borderline subarctic climate. Winters are relatively cold with an average daily temperature ranging from -4.0°C to -17.7°C and an average minimum temperature of -23.4°C in January. Summers are warm with average daily temperatures of 14.2°C to 17.1°C and an average daily maximum of 23.1°C in July. Precipitation ranges from an average of 29.6mm in February to 122.9mm in July (Climate Canada website).

Topography on the Urban-Barry property is typical of the Canadian Shield. The area is relatively flat and low-lying with very few hills, ridges or other increases in elevation (max. 20m). Because of this, the area is poorly drained and consists of a large proportion of swamps and muskegs. The Urban-Barry property's main claim block is bisected by the St-Cyr River. All waters in the area eventually drain into James Bay by way of the Opawica, Waswanipi and Mégiscane Rivers (Joly, 1990). Vegetation consists predominantly of conifers (Spruce, Pine and Fir) with minor deciduous species (Birch, Aspen and Poplar). Most of the unmaintained logging roads are overgrown with Alder and Birch. Crown cover varies from near-zero in swamps and wet areas to 70% and up in older patches not logged in the 1990's as well as deciduous clusters and older/ healthier plantation areas.

Significant overburden at Urban-Barry has been the main limiting factor to exploration in the past. Depth can range from 0-60m in thickness and averages as much as 25m. 2017 diamond

drilling averaged 21m through overburden to bedrock. Due to the low-lying relief and the thickness of overburden, there has not been any outcropping found on the property, though a minor amount can be found immediately adjacent to the north of the claims. The Chanceux claim block has minor outcropping but it is significantly to the south and on the east side of the St Cyr River. The Chanceux block was not worked on in 2017 nor was any outcropping there deemed as pertinent to 2017 exploration work.

3. Property

3.1 Mineral Claims

The property consists of two claim blocks totaling 1,296.67 hectares: the main Urban-Barry block and the Lac Chanceux claims. The main block is composed of twenty (20) contiguous claims totaling 1127.44 hectares. The Lac Chanceux claims comprise three (3) contiguous claims totaling 169.23 hectares. Aldever acquired a 100% interest in the Urban Barry Gold Project in November 2015 when they entered into an agreement with Urania Resource Corp. The agreement included the issuance of 3.5 million shares, a $250,000 payment and by incurring $1M in qualifying exploration expenditures over a five-year period. In December 2015, Aldever acquired a 100% interest in the Lac Chanceux gold claims by entering into an agreement with Garmin Metals and Mining Corp. The agreement included the issuing of 300,000 common shares, a $50,000 payment and by incurring $200,000 in qualifying exploration expenditures over a five-year term. The claims can be found listed in Table 1 below and their locations are plotted in Figure 2.

Table 1. List of claims for the Urban-Barry Property.

Reports (IP interpretation and assessment)	8,125
Total	**331,533**

3.3 History and Previous Exploration

Historically, the claims that make up the Urban Barry property have been underexplored. The region surrounding the property, however, contains numerous showings and deposits--providing ample evidence of potential in the area. Since the 1994 discovery of the Barry deposit by Murgor Resources, exploration efforts in the area have dramatically increased, resulting in the discovery of multiple deposits and showings, including: The Windfall Lake deposit, the Nubar deposit, the Gladiator Zone, the Belmont showing and the Lac Chanceux Nord Cu showing. The bulk of the historical work involves large-scale geological and geophysical surveys that included parts or all of the present claims within their scope.

The earliest reports related to work completed on the Urban-Barry claims consists of large-scale geological investigations undertaken by B.C. Freeman (RP142A) and R.L. Milner (RG014A) for the Province of Québec's Department of Mines in 1939. Before this, most of the territory had been either unmapped, or had been the subject of reconnaissance exploration. The discovery of massive sulfides carrying low anomalous gold values as well as the discovery of free gold in quartz veins prompted an interest in the Buteux region of the Abitibi (Freeman, 1939). Milner's work (geological mapping) covered the entire claim block westward towards Lac Windfall and Lac Barry, whereas Freeman's territory (investigating mineral indices and a geological survey) extended east from the western edge of Lac Chanceux, covering Lac Hébert eastward past the Pascagama River into Marceau Township. Both noted that outcropping was scarce and mostly concentrated along ridges and hills adjacent to rivers and lakes. Report RP143(A) mentions a

trench located on the north-western shore of Lac Chanceux (just west of the Chanceux claim boundary) that measures 100 feet in length and cross-cuts lithological contacts. Rock outcropping 30 feet to the south of the trench was mapped as Andesite with fine disseminated Pyrite. The trench intersected tuff and talc-schist with quartz veining and localized carbonization but returned no significant assay values.

The next reported works involved a massive airborne EM survey conducted by Shell Canada in 1977 (R.J. de Carle, 1977). Questor Surveys Ltd. Flew 1,524 line kilometers using a Trislander C-GOXZ at 400 feet with the bird at 150 feet and 200m line spacing. A follow-up was conducted in 1977 (Côté, 1977) where VLF and geological mapping was completed on all conductors identified from the airborne EM. From the maps, it appears that while claims from the Urban-Barry property were included, nothing of note was followed-up on.

The government of Quebec was the next entity to commission geophysical work over the area (Gobeil, 1983). In 1981, Questor Surveys Ltd. flew an EM survey over the Marin-Barry region, with data compiled by Les Relevés Géophysiques Inc. The data was transposed over aerial photographs taken in 1967 and 1971 at a 1:40,000 scale. The entire NTS sheet 32G03 was among the territory covered. The survey identified numerous anomalies east and west of Lac Chanceux and all along the Urban Deformation Zone.

For several years, a portion of the Urban-Barry claims were included in the Eagle River Property, a joint venture project between Les Ressources Oasis and Mines Masseguay Inc. They completed geophysical surveys in both 1987 (McCurdy, 1987) and 1988 (McCurdy, 1988) before doing follow-up work in 1989 (Richer, 1989) that included geological mapping and sampling.

The Ministère de l'Énergie et des Ressources conducted an aeromagnetic survey in 1988 (DV 88-06). The survey was flown at a height of 125m with a 200m line spacing. This survey covers all the Urban-Barry claims. In 1990, the MER commissioned a team to conduct geological mapping of the area around Lac Aux Loutres and Lac Lacroix, in the western end of the UBGB using helicopters and canoes. Their objectives were to define the lithostratigraphic units,

elaborate on the structural analyses and to investigate mineral showings (Joly, 1990). Their findings are in report MB 90-42.

The claims then became incorporated into Aur Resources' Belmont Property, which was the subject of a helicopter-borne Mag, EM and VLF-EM survey in 1997 with follow-up work completed later that year. An IP survey was completed on parts of the Belmont Property in 1998 (Plante, 1998), two lines of which fall on the current Lac Chanceux claims that make up part of the Urban-Barry property.

Murgor Resources then picked up the claims, conducting their own helicopter-borne EM survey in 2004. At this point the claims once again fell under the Eagle River Property. Several additional programs were conducted on the claims, including: Helicopter-borne VTEM in 2004, resistivity and IP surveys at Lac Chanceux in 2005, regional-scale prospecting in 2008 and horizontal loop EM that covers parts of the claims conducted by Murgor Resources.

It appears that from 2005-2006 until 2016, the Urban-Barry claims were not part of any regional exploration efforts by any companies or individuals. They were again active in 2016 when EFU Inc. conducted a soil sampling survey, a Beepmat survey, a ground magnetometer/ VLF-EM survey, and minor backpack drilling. The backpack drills were both used to drill rock at the Chanceux claims and to drill and collect soil samples through up to 3.9m of peat in swampy areas on the main claim block.

In 2016, EFU collected 526 soil samples from the claims in 2 programs—an original 244 samples were collected in May-June and a follow-up 282 samples were taken in August. 89.3-line km of Beepmat was walked and a 57.6 line-km magnetometer/ VLF-EM survey was conducted and interpreted. 15 backpack drill holes were drilled and sampled but, in most cases, the rock sampled was boulder or subcrop. The Chanceux claim block was the only location where outcrop was located on the claims. The VLF-EM survey identified several anomalies concentrated within the southern domain of intermediate to felsic rocks. A follow-up max-min

or IP survey was recommended. Contouring of the soil samples identified several areas of anomalous Au, Ag and Cu concentrations which also required additional investigation.

4. Regional Geology

Regional Geology taken from (McLaughlin et al., 2015) and (Rhéaume et Bandyayera, 2006):

The Urban Barry property lies within the Urban-Barry Greenstone Belt which is in the eastern part of the Abitibi sub-province. The greenstone belt has an east-west extent of roughly 135km and varies in width from 4 to 20km. It is bounded to the north by the Urban Deformation Zone, to the east by the Grenville Front, to the south by granitoid rocks of the Barry complex and to the west by the granitoid rocks of the Souart Pluton. The Urban Deformation Zone is a major east-trending Archean shear zone that separates the Urban-Barry Greenstone Belt from the granitoid rocks of the Hébert and Father Plutons. The Grenville Front is a major Proterozoic discontinuity that truncates Archean rocks in a north-northeast direction.

The Urban-Barry Greenstone Belt (UBGB) is subdivided into five rock formations, interpreted to have formed between 2,791 and 2,707 Ma: The Urban, Macho, Fecteau, Lacroix and Chanceux. All five formations are imbricated and separated by thrust faults with oblique movement. The Fecteau Formation is the oldest in the Urban Barry Greenstone Belt. The Urban Formation is located at the base of the stratigraphy and consists of massive or pillowed Tholeiitic basalt, gabbro sills and felsic volcanic rock. The Macho Formation consists of massive or pillowed basalt units interbedded with felsic volcanic units. It also contains massive gabbro units and metasedimentary sequences composed of wacke, mudstone and conglomerate. Volcanic rocks of the Macho Formation, including rocks of the Windfall Member, are cut by a series of quartz and/or feldspar porphyry dykes. Samples taken from the Barry Gold Deposit dated these dykes at 2,697 ± 0.6 Ma. The contact between the Urban and Macho Formations is marked by the Milner Shear Zone in the western part of the UBGB, and by the southern limit of the Urban Deformation Zone in the eastern part of the UBGB. The Romeo Formation is composed of clastic metasedimentary rocks that locally contain metamorphic layering. It is located north of

the Urban Formation, and its contact with the Urban Formation is marked by the northern limit of the Urban Deformation Zone. Rocks of the UBGB were deformed during the 2,710 to 2,660 Ma Kenoran orogeny. The regional foliation generally strikes northeast to east-northeast with a variable dip from 30 to 85° to the southeast. The regional foliation is associated with a stretching lineation that plunges steeply to moderately to the east. Associated regional folds are generally isoclinal with steeply plunging axes, although Bandyayera et al. (2002) interpreted a shallowly-plunging regional-scale syncline south of the Windfall Member (named Urban Syncline). A series of east-northeast-trending shear zones characterized by strongly developed foliation occur in the UBGB and include the Milner, Masères, Saint-Cyr and Barry Shear Zones. As you approach the Urban Deformation Zone (UDZ) in the northern part of the belt, stratigraphic contacts, regional foliation and spaced cleavage become re-oriented in a predominantly east-west direction, paralleling the UDZ.

A set of north-northeast-trending brittle faults associated with slickenlines that are moderately plunging to the northeast crosscut all other structures. Such faults are likely related to the Grenville Front and include the Thubière, Croft, Picquet, Father, Roméo and Windfall faults. Rocks of the UBGB are generally metamorphosed to greenschist facies, although near intrusions, conditions locally reached amphibolite assemblages. The regional metamorphic temperature-pressure gradient generally increases eastward towards the Grenville Front.

5. Property Geology

The limited amount of historical work completed on the Urban Barry claims, coupled with the lack of surface outcropping and deep overburden depths means the bulk of the interpreted property-scale geology has been derived from surface and sub-surface work completed on adjacent properties within the UBGB. The property-scale geology at Urban Barry consists of three main Formations (per the Quebec Government's website, SIGEOM): Urban, Macho and Chanceux. Structurally, the main property is cut by several regional-scale faults (Saint-Cyr, Milner and Rouleau) as well as a regional-scale shear zone: The Urban Deformation Zone. The

Barry Fault cuts across the top North-West corner of the Lac Chanceux claim block before paralleling the claim boundary.

The rocks of the Chanceux Formation (2727 Ma) are associated with the first cycle of volcanism in the area that cover the basal Fecteau Formation (2791 Ma) (Rhéaume et Bandyayera, 2006). The Chanceux Formation rocks are interstratified intermediate to felsic volcanic rocks and epiclastic sedimentary rocks that characterise the end of the first volcanic cycle of the Urban-Barry. Rocks in this formation consist primarily of tholeiitic basalts, rhyodacitic or rhyolitic tuffs of calc-alkaline to transitional composition as thin beds with interstratified greywacke and graphitic argillites, intermediate tuffs and synvolcanic gabbros. The Chanceux Formation also includes the rocks bounded by the Barry, Milner and Saint-Cyr Faults, and are mainly composed of greywackes (sometimes magnetite-rich), mudstones and tuffs. The greywackes are quite abundant between the Barry and Saint-Cyr Faults, as well as to the south of Lac Chanceux, and due to their chemical composition, very likely represent the results of the erosion of the Chanceux Formation volcanics.

The Macho Formation refers specifically to a group of predominantly mafic volcanic rocks bounded by the Milner and St-Cyr Faults. These rocks formed 2718 Ma during the UBGB's second cycle of volcanism and are divided into two distinct lithostratigraphic units: The Windfall Member and the Rouleau Member. The Macho Formation consists mainly of basalts, andesites and andesitic basalts of transitional island arc settings. It also contains minor amounts of tholeiitic seafloor basalts and synvolcanic gabbros.

The Urban Formation (2707 to 2714 Ma) is the largest of the formations belonging to the UBGB, extending for over 125km from Lac Wilson to Lac Roy (Rhéaume et Bandyayera, 2006). The bulk of the Urban Formation consists of tholeiitic basalts with minor amounts of synvolcanic gabbros, felsic volcanics and sediments. The Urban Formation is a sequence of young effusive rocks with two important felsic centers within the formation: the Novellet Member (2714 Ma) and the Freeman Member (2707 Ma). The Urban Formation represents the third, and last, cycle of volcanism for the UBGB.

Property-scale geology and structures, as per the SIGEOM interactive website, can be found in Figure 3.

6. 2017 Exploration

In the spring of 2017, Exploration Facilitation Unlimited Inc. was asked to complete a reevaluation of all data related to the Urban Barry and Lac Chanceux claims, including data from adjacent properties with known mineralization and data collected during the 2016 field season. Based on interpretations and previous works, EFU was then to recommend an exploration program that would hopefully clarify/ enhance the known potential of the Urban Barry property. Based on the available data from a variety of sources, including government websites, a five-week program consisting of ground geophysics (Induced Polarization) and NQ diamond drilling was proposed. In total, nine (9) line-km of survey line were cut and six (6) line-km of IP survey and 1,372m of diamond drilling were completed.

6.1 Geophysics

6.1.1 Induced Polarization (IP)

The 2016 magnetometer survey identified a new structure; a fault that enters the main claim block in the very south-west corner and trends 045° to the north-east. An apparent pattern of elevated gold-in-soil values appears to occur sub-parallel, and northwest of, the fault. This soil anomaly pattern is approximately 500m to the northwest of the fault and appears to be on a slightly more northward trajectory. This difference in orientation could be due to glacial movement or the presence of an en-echelon gold-bearing structure. With this in mind, and a focus on discerning gold mineralization, an IP program was designed to cross this possible mineralization plane with lines oriented east-west. Nine (9) kilometers of line were cut for IP and six (6) kilometers of survey were completed.

Significant obstacles were faced during the summer IP program. The area chosen for the IP survey was relatively flat and unfortunately, very wet. The creation of a new beaver dam within

the bounds of the IP grid in the last two or three years compounded this issue. Lines were worked to the edges of swamps and ponds and then moves were conducted to the other side of wet ground, greatly slowing down the survey process. Vegetation to be cut was thick due to the available moisture in some of the survey area as well. Abundant alders slowed down progress and made cutting slow and onerous. In the end, the area deemed most prospective was cut and surveyed as time and budget became limiting factors.

Analysis and interpretation of the results of the IP survey indicated that a north-south orientation of lines may have been preferred. Results are deemed inconclusive at present. The complete set of results of this analysis can be found in the accompanying report from MBGeosolutions titled "Report of an Induced Polarization survey on the Urban-Barry Property". On site, the initial raw data of IP pseudo sections was analyzed, and drill holes were designed to attempt to test the strongest apparent anomalies from the IP survey. A decision was made to use the raw data as a proxy for detailed analysis in order to take advantage of easy access during summer months and the presence of a camp and crew on site. Awaiting a full analysis of the data would have involved costly remobilization of the crews already present. A drilling crew was available at the time and EFU staff from the IP program were available to process core and manage the drilling program.

Figure 4 shows the location of the IP survey lines with respect to the claims. For the set of figures displaying the results of the IP survey, please refer to Jean Hubert's report, submitted with this assessment report.

6.2 Drilling

Immediately after the June IP program, Forages Rouillier of Amos, Qc. was contracted to drill 1,372m to follow up on the apparent anomalies from the IP survey. The drill arrived about 6km from the drill sites on a lowbed on the 21st of June 2017 and was mobilized to the same landing for transport away on the 7th of July. The EFU crew, final samples, and camp were demobilized on the 8th of July. Samples were all delivered to ALS Labs in Val-d'Or Quebec for analysis.

The drilling was completed on five (5) holes with depths varying from 189m to 364m. Holes were all drilled from the main road on the west side of the claims near a junction with the main access road used for this program. The five collars span a distance of 350m along the road with four of the holes drilled to the east and the 5th and final hole drilled to the SSE. Extremely wet and swampy ground indicated that it would have been preferable to complete the drilling in winter. It would have been ideal to place the drill as close to the target areas as possible and then drill steep, direct holes. Due to the distance between the collar and the apparent IP anomalies, holes were drilled at shallow angles causing them to be much longer than desired.

Hole UB17-001 was designed to cross apparent mineralized keel structures in Line 600, features identified by the IP but most apparent in the chargeability. The top of the hole was designed to pierce a more western keel and continue on to intersect the stronger eastern chargeability zone at a depth beyond that of the IP survey. The apparent anomaly was strong and appeared to be dipping to the west. It appeared to have a width of 100m on Line 600 and narrowed significantly to both the north and south. The final geophysical interpretation confirmed this same apparent feature. Hole 001 was drilled to the east at -55 to a depth of 310m and is comprised almost entirely of mafic volcanics. There are 18m of rhyolite/felsic dyke in four intervals, 4.6m of greywacke in two intervals, and a 40cm Iron Formation interval composed of banded quartz-chlorite-magnetite-pyrite. The mafic volcanics contained local concentrations of amygdules with quartz fill. The rock displayed a pervasive foliation beyond initial S0 and was pervasively quartz-sericite-chlorite altered with varying strengths in alteration. Tourmaline alteration, potassic alteration, and ankerite alteration were all seen and are locally nil to strong. Veining comprised less than one percent of rock and was highlighted by a 44cm quartz-tourmaline-ankerite vein. Sulfides were mostly limited to pyrite with very minor traces of chalcopyrite, sphalerite, pyrrhotite, galena, and arsenopyrite.

Hole UB17-002 was designed to cross the same chargeability anomaly as hole 001 but to the south, on Line 500 of the IP survey. Hole 002 was drilled to the east at -50 degrees and was planned to intersect the continuation of the chargeability anomaly, extended down-dip along

its apparent strike. This would also have the hole piercing a closer and weaker anomaly with the same apparent dip as the main anomaly. Hole 002 was composed of mafic volcanics with a 2.2m interval of rhyolite/felsic dyke deep in the hole. Volcanics in hole 002 had abundant local zones of pillowed flows. Pillow rinds were quartz-tourmaline-calcite altered, with occasional pyrite alteration as well. The mafic volcanics had intervals of hydrothermal brecciation with quartz-calcite-ankerite breccia matrix/fill. The volcanics were also locally clastic with clasts up to 10cm; clasts appear to be of mafic volcanics as well. The volcanics were quartz-sericite-chlorite altered pervasively with local variations in intensity from almost nil to intense. Tourmaline and ankerite alteration was seen locally. Veining to a maximum size of 7cm comprises less than 1% of the rock and veins are of a mix of quartz-sericite-calcite-ankerite-pyrite-pyrrhotite with very minor rhodocrosite. Pyrite comprises 1% of the rock overall but can be as high as 50% locally. It is usually locally weakly disseminated but can be locally semi-massive with pyrrhotite. Extremely minor traces of very fine-grained chalcopyrite and sphalerite were also seen.

Hole UB17-003 was designed to pierce the interpolated/likely southern continuation of the chargeability anomaly. Hole 003 was on Line 400 from the IP survey but very little of Line 400 was surveyed due to a recently built beaver dam and an east-west running pond. The pond commences just east of the drill sites. Hole 003 was drilled east at -60° and intersected only mafic volcanics over its 289m length. The volcanic sequence in hole 003 included minor amounts of amygdules locally, but no pillows were noted. Quartz-sericite alteration was common throughout the hole with alteration intensity varying from nil to locally. Very minor amounts of tourmaline and ankerite were noted. Veining was <1% with the largest vein in the hole measuring 12cm.

Hole UB17-004 was designed to pierce the northern reaches of the IP-indicated chargeability anomalous zone. The hole was drilled to 219.2m on a -50 dip towards the east from Line 700 of the IP program. Hole 004 encountered 211m of mafic volcanics and a total of 8m of felsic/ rhyolite dyke in two separate intervals. Hole 004 has numerous intervals of pillowed flows, with

pillow rinds commonly quartz-tourmaline altered. Quartz and sericite were again mostly pervasive throughout hole 004 but were much weaker than noted in previous holes. Tourmaline and trace ankerite were observed locally. Chlorite alteration was pervasive and moderate to strong throughout the volcanics.

Hole UB17-005 was designed to cross under interesting/veined/altered rock from the top of Hole 001 and hit the chargeability anomaly on line 500 (Hole 002). Unlike other holes, which were drilled at an azimuth of 90°, hole 005 was drilled at an azimuth of 150° to a depth of 189m. In previous holes, foliations and contacts were intersected at low angles to core axis, indicating that holes were crossing limited stratigraphy. Despite adjusting the drilling angle, hole 005 also intercepted foliations at low angles to core axis. 175m of the 189m was mafic volcanics. There was fourteen meters of rhyolite/felsic dyke in four occurrences, with the largest being the last seven meters of the hole. There are local pillows and amygdules in the volcanics with pervasive Qz-Ser-Chl alteration throughout the hole. Alteration intensity of all three varies from almost nil to intense locally but they are all weak to moderate overall. Very minor ankerite and tourmaline were seen locally, and they were both concentrated in veining and pillow rind alteration. Veining overall was very weak with the largest vein at 3cm width.

7. Analysis, Results and Discussion

Drill hole traces in both plan and section view can be seen in Figures 5 to 10 in Appendix A. All samples collected were submitted to ALS Labs in Val-d'Or, Québec for analysis. All core samples were split with a hydraulic splitter and bagged and tagged by EFU employees at the EFU camp—the site of the core shack and all core processing. The splitting area and cutter were cleaned after each sample to avoid potential cross-contamination. Samples were placed in clear plastic bags with the sample number written on the outside of the bag. A paper tag from the lab was then inserted in the bag before sealing the bag with a zip tie. All bags were triple checked for correct ID numbers before leaving site and were delivered by EFU employees to the lab in person. Standards, blanks, and duplicates were inserted into the sample stream by EFU at a rate

of one of each per 60 samples. The samples were delivered by pickup truck in four (4) batches during the program to avoid congestion at the camp and because of the weight of the samples.

A secondary batch totaling four samples was delivered to Activation Labs in Ancaster, Ontario in February of 2017 to follow up on a high assay value within a shoulder sample.

7.1 Data Analysis – Induced Polarization

IP data was collected using a Juniper "Allegro2" handheld device using a Windows platform and connected to a GDD GRx-8mini receiver with a GDD TxII Transmitter and a Honda 6.5kW generator power source. The data from the IP survey was sent to a geophysicist registered in the Province of Québec, as required by law, for processing and interpretation. The results and interpretations can be found in the report titled "Report of an Induced Polarization Survey on the Urban-Barry Property" submitted along with this report. It should be noted that the timeline set for drilling meant that the raw data viewed using GDD's "IP PostProcess" software was used in the field to plan drill holes, not the interpretations and results of the geophysical report.

7.2 Sample Analysis – Drill Core

533 samples including 507 drill core, 12 duplicates, 5 blanks, and 9 standards were collected from the Urban Barry drill core logging program and they were submitted to ALS labs in Val d'Or for analysis in four (4) batches. Sample deliveries were made to the lab on June 26th (187 samples), June 30th (142 samples), July 6th (141 samples) and July 10th (62 samples). A final load of four samples was submitted to Activation Labs in Ancaster, Ontario on February 14th, 2018.

At ALS samples were crushed to 70% passing <2mm before being split with a riffle splitter. The split was then pulverized to 85% passing <75µm before analysis. 50g samples were analyzed for Au by fire assay with an AAS finish in addition to the multi-element aqua regia ICP-AES analysis. ME-ICP41 analysis, which combines Aqua Regia digestion and analysis by ICP-MS, provides low detection limits for: Ag, Al, As, B, Ba, Be, Bl, Ca, Cd, Co, Cr, Cu, Fe, Ga, Hg, K, La, Mg, Mn, Mo,

Na, Ni, P, Pb, S, Sb, Sc, Sr, Th, Ti, Tl, U, V, W and Zn. One standard per 15 samples and one blank per 20 samples were added to the Au sample stream as well as a duplicate for each 20 samples. For the ICP-AES sample stream for QA/QC purposes ALS added a duplicate per 20 samples and a blank or standard every 10 samples. Sample preparation and analysis were completed at the ALS laboratories in North Vancouver, BC for the most part with a minor amount of the prep done (142 samples) at the Thunder Bay lab.

At Actlabs, samples were prepared by first being crushed to a nominal -2mm. Samples were then mechanically split to obtain a representative sample before being pulverized to at least 85% passing -105 microns. Samples were analyzed using Instrumental Neutron Activation Analysis (INAA) whereby samples are encapsulated and irradiated in a nuclear reactor. After a suitable decay, samples are measured for the emitted gamma ray fingerprint (Actlabs website). INAA is a good tool for measuring concentrations of Au, Co, As, Sb, W, Ta, U, Th, Cs, In, Re, Cl and lower levels of most LREE. Samples submitted by EFU were analyzed for Ag, As, Au, Ba, Br, Ca, Ce, Co, Cr, Cs, Eu, Fe, Hf, Hg, Ir, La, Lu, Mo, Na, Nd, Ni, Rb, Sb, Sc, Se, Sm, Sn, Sr, Ta, Tb, Th, U, W, Yb and Zn. The lab inserted two standards and one blank into the sample stream as part of their internal QaQc program.

7.3 Discussion of Results, Recommendations

Multiple chargeability anomalies were identified from the IP data. Although imperfect, the choice of drill holes in the field represented a reasonable follow-up on the IP data. The holes intersected the best final interpreted anomalous chargeability zones on the grid on multiple lines. Holes were drilled towards the intersection of the Rouleau and Milner faults as determined by the 2016 ground magnetometer/ VLF-EM survey (Hubert, 2016), giving the possibility of a dilation zone and potential mineralization in the shadow of the intersection. They were also drilled towards EM conductors to the east also identified in the 2016 survey.

Results of drill core assay provided only anomalies rather than high-grade intercepts. The highest gold assay was 0.239g/t Au over 1.0m. Most gold and silver values were below

detection levels (5ppb and 0.2ppm respectively). The highest silver assay was only 1.0g/t and generally base metal values were low with the singular exception of zinc. Sphalerite was noted during core logging and zinc values were as high as 7500ppm Zn over 0.55m and 5400ppm Zn over 1.09m. There were additional highly anomalous values in several holes.

The best gold grade of the project was seen in Hole 001 with 0.239ppm Au over 1.0m or 0.097ppm Au over 3.0m. This grade was associated with veined mafic volcanics at 39m to 40m with the larger interval from 37m to 40m in depth. Copper was inconsequential with the highest copper assay at 333ppm over 0.50m. The highest silver grade, 1ppm, was also at the top of the hole at 34.36-36.02m (1.66m). The same sample, a contact between felsic dyke and mafic volcanics, also assayed 1240ppm (0.124%) zinc. Sample 125006, which assayed 0.239ppm Au, was a shoulder sample to an expected high grade for sample 125005. As a result, in February 2018, four additional 1m samples, taken immediately downhole of sample 125006, were collected to investigate the potential for additional anomalous gold grades. Unfortunately, the four meters of core returned no significant assays.

Some of the most promising assays of Hole 002, from 291.04m to 291.59m, returned 7510ppm (0.75%) zinc. Over a larger interval from 290.50m to 291.59m, the grade was 5400ppm (0.54%) zinc. A weaker anomaly is located up-hole, from 286m to 289m, with a weighted average of 512ppm zinc (0.05%) over 3m. In both cases, sphalerite was seen in the core during logging. The highest copper assay was 197ppm and nickel peaked at 256ppm. The most elevated silver was only 0.4ppm Ag. It should, however, be noted that the interval with 0.4ppm Ag, from 340.30m to 340.80m, also assayed 106ppm As, 18ppm Pb, and 571ppm Zn (0.06%). The lead and arsenic values were extremely anomalous as they were both the highest in their category for the program. The assayed rock was intensely pyrite-chlorite altered mafic volcanics with 35% pyrite. The best assay for gold in hole 002 was also from 340.30m to 340.80m at 92ppb Au. From 340.80m to 341.61m, the hole graded 55ppb Au. Although these assays are extremely anomalous, they are not of economic importance unto themselves. The anomalous values deep in the hole are all coincident with where the drill hole should have intersected the anomalous

chargeability zone. This may indicate proximity to a source of higher metal concentrations or these may be the highest grades for the area. To determine this, the area needs to be tested by future drilling, possibly in a different orientation.

There were no assay values of note in Hole 003 with the highest gold value at 7ppb, the highest silver value at 0.2ppm, the highest copper value 113ppm, the highest zinc value 139ppm, and the highest nickel assay 193ppm.

Limited elevated anomalies were seen in hole 004 with the highest assays returning 151ppm Cu, 256ppm Ni, 164ppm Zn, and all silver assays below detection levels. The bright spot was two separate anomalous gold values. From 20.0m to 21.0m in veined mafics the assay value was 84ppb Au and 117.4m to 118.8m assayed 71ppb Au. Almost all other values for gold were below detection limits of 5ppb Au.

Hole 005 had generally low gold values with a highest value of 24ppb Au from 132.89 to 133.6m in veined mafics with 15% veining. Silver was also low with almost all values below detection levels of 0.2ppm Ag. The highest silver value was in mafics from 60.0 to 61.0m at 0.5ppm Ag. A trace of visible sphalerite was noted in the log for this interval. Copper was generally low with the highest assay at only 160 ppm Cu. The highest nickel and zinc values were both found from 118.50 to 119.00m in mafics with weak signs of shearing and pyrite fill in the shears. Nickel assayed 285ppm Ni (0.03% Ni) while the zinc assay for this sample was 589ppm Zn (0.06% Zn). It should be noted that from 117.5m to 135m, twelve samples grouped into three intervals (117.5m to 119.0m, 123.0 to 126.0m, and 129.5 to 135.5m) all contained elevated arsenic assays, with values from 27ppm to a peak of 102. Zinc and nickel were also elevated throughout this interval.

The results of the diamond drilling program showed the continued presence of anomalous metal concentrations on the Urban-Barry property. Follow-up work is recommended to investigate the source of these metals and should include additional ground-based geophysics such as Max-Min, additional IP or even a gravimetric survey.

9.0 STATEMENT OF QUALIFICATIONS

I, Abby Peterson, P.Geo. do hereby certify that:

1. I am an employee of Exploration Facilitation Unlimited Inc. with my office based at 946 Lynwood Drive, Sudbury, ON, P3A 3N4.

2. I am a graduate of McGill University, Montréal, in the Province of Québec, with a Bachelor of Science degree in Earth and Planetary Sciences.

3. I am registered as a Professional Geoscientist (P. Geo./Géo) in the Province of Québec with the Ordre des Géologues du Québec (OGQ No.1463).

4. I have practiced my profession as an exploration geologist in the mineral exploration industry continuously since 2005. I have worked on gold and base metal exploration projects as a geologist in Ontario, Nunavut, the Yukon Territory, Québec (including Val d'Or) and in Burkina Faso, West Africa.

5. This report is for Assessment purposes and is not intended to be a NI 43-101 compliant report; nevertheless, it has been prepared with care.

6. I am responsible for the preparation of all sections of this report except for the Expenditures, which was prepared by EFU Inc. management.

7. I visited the Urban Barry Property personally on July 27th, 2017. During this time, I went through all the core with J. Rensby, Géo, including logging and sampling procedures and results.

Abby Peterson

CERTIFICATE VO17137903

This report is for 142 Drill Core samples submitted to our lab in Val d'Or, QC, Canada on 6-JUL-2017.

The following have access to data associated with this certificate:

REZA MOHAMMED		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
LOG-24	Pulp Login - Rcd w/o Barcode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS

To: **CANEXPLOR MANAGEMENT LTD**
ATTN: REZA MOHAMMED
222-515 WEST PENDER STREET
VANCOUVER BC V6B 6H5

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VO17137909

This report is for 142 Drill Core samples submitted to our lab in Val d'Or, QC, Canada on 6-JUL-2017.

The following have access to data associated with this certificate:

REZA MOHAMMED

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
LOG-24	Pulp Login - Rcd w/o Barcode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS

CERTIFICATE VO17159607

This report is for 142 Drill Core samples submitted to our lab in Val d'Or, QC, Canada on 6-JUL-2017.

The following have access to data associated with this certificate:

REZA MOHAMMED

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **CANEXPLOR MANAGEMENT LTD**
ATTN: REZA MOHAMMED
222-515 WEST PENDER STREET
VANCOUVER BC V6B 6H5

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VO17162547

Project: URBAN BARRY

This report is for 184 Drill Core samples submitted to our lab in Val d'Or, QC, Canada on 29-JUN-2017.

The following have access to data associated with this certificate:

REZA MOHAMMED		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **CANEXPLOR MANAGEMENT LTD**
ATTN: REZA MOHAMMED
222-515 WEST PENDER STREET
VANCOUVER BC V6B 6H5

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VO17209457

Project: URBAN BARRY

This report is for 62 Drill Core samples submitted to our lab in Val d'Or, QC, Canada on 28-SEP-2017.

The following have access to data associated with this certificate:

REZA MOHAMMED		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS

To: **CANEXPLOR MANAGEMENT LTD**
ATTN: REZA MOHAMMED
222-515 WEST PENDER STREET
VANCOUVER BC V6B 6H5

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

QC CERTIFICATE VO17136550

Project: URBAN BARRY

This report is for 187 Drill Core samples submitted to our lab in Val d'Or, QC, Canada on 29-JUN-2017.

The following have access to data associated with this certificate:

REZA MOHAMMED		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
LOG-23	Pulp Login - Rcvd with Barcode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

QC CERTIFICATE VO17137903

This report is for 142 Drill Core samples submitted to our lab in Val d'Or, QC, Canada on 6-JUL-2017.

The following have access to data associated with this certificate:

REZA MOHAMMED

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
LOG-24	Pulp Login - Rcd w/o Barcode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS

To: **CANEXPLOR MANAGEMENT LTD**
ATTN: REZA MOHAMMED

QC CERTIFICATE VO17159607

This report is for 142 Drill Core samples submitted to our lab in Val d'Or, QC, Canada on 6-JUL-2017.

The following have access to data associated with this certificate:

REZA MOHAMMED

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **CANEXPLOR MANAGEMENT LTD**
ATTN: REZA MOHAMMED
222-515 WEST PENDER STREET
VANCOUVER BC V6B 6H5

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS

4 Rock samples were submitted for analysis.

The following analytical package(s) were requested: Code 1D INAA(INAAGEO)

REPORT **A18-01803**

Notes:

For values exceeding the upper limits we recommend assays.

CERTIFIED BY:

Emmanuel Eseme , Ph.D.

SUMMARY

0.00-19.91m: Overburden.
19.91-194.54m: Mafic volcanics, light greenish-grey in color. Minors of greywacke/sandstone and rhyolite dykes. Locally amygc
194.54-198.15m: Rhyolite dyke, tan with black spots.
198.15-310.00m: Mafic volcanics, 3% disseminated Pyrite increasing with depth.
310.00m EOH

DDH #: **UB17-001**

Logger: J. Rensby

MAJOR UNIT		MINOR UNIT		ROCK CODE	DESCRIPTION
FROM (m)	TO (m)	FROM (m)	TO (m)		
0.00	19.91			**OVB**	
19.91	34.36			**RDK**	Light grey with minor black spots, vfg-mg rhyolite dyke. Minor local rubble, mostly angular. Locally oxidized due to surface proximity. Foliation (S1) at 25-30 TCA locally. LCT at 30 TCA. Chl 1% weak and patchy. Qz 5% weakly pervasive. Tm 1% as local spotting and fracture fill/ annealer. Veining <1% as Qz veins at low angles TCA (15-25) with minor Ser 1% halos. Py 1% as local patchy blebs. Sph 0.1%, (Cpy) as Py associated blebs.
34.36	194.54			**MV**	Light green-grey to locally light grey or darker green, vfg- minor mg mafic volcanics with minor GWY-dirty SST or RDK interludes uphole in unit. Unit is mostly competent with minor angular rubble. Minor oxidation due to surface proximity uphole in unit. S1 at 25-30 TCA. Weak pervasive Ser 5%- Qz 10% with (Chl) alteration patchily distributed. Minor amygdules/ inclusions locally with Qz-Ank 0.5%-Py replacement/ fill. Veining >1% is a local mix of Qz+/-Cal+/-Ank+/-Tm+/-Chl+/-Ser with varying ingrdients in different veins. Ser halos to 2mm are common as is a weak Py-(Sph-Cpy-Po) association with veining. Veining is occasionally sheared into segments. Py 1%- (Sph-Cpy-Po) as fg xtal to cg xtal and as minor bleb. (Cpy) seen as a replacement of Py xtals.
		34.36	36.02	**MV**	contact zone between dyke and volcanics with a mix of both. Py 2%- Sph 0.5% in this interval.
		36.02	38.38	**GWY**	Gradational contact into a coarser grained, light grey GWY/ dirty sandstone interbed.
		37.40	37.44	**Vein**	2cm smoky Qz vein at 25 TCA (foliation subparallel) with Tm-Py halo/ margins.
		38.94	38.97	**Vein**	20mm smoky Qz vein with a 1cm Py disseminated specks halo.
		46.20	48.46	**GWY**	Nondescript, weakly Qz-Ser altered fg-mg GWY/ dirty SST bed. LCT at 20 TCA.
		62.62	62.80	**Vein**	9cm Qz-Tm vein at 35 TCA with a Qz halo and Qz-Tm within. (Py) in halo with Ser and Qz.
		67.90	69.00	**MV**	Abundant Qz inclusions/ amygdules through this interval. Inclusions have Ank rims and (Sph) with Ank. Other inclusions are Qz with vfg Py rims.
		85.45	85.80	**Vein**	Ladder-style Qz-Cb-Tm 2cm vein at 15 TCA. Vein contains minor Py.
		93.26	96.65	**MV**	interval with series of 2 offset (by 2cm)/ sheared Qz-Chl-Ser veins with associated Py both in vein and in halo. Py is cg and Ser halo is 2cm.
		110.20	112.90	**MV**	interval with abundant amygdules/ phenocrysts. Appear to be Qz-Sph 1% rimmed.
		140.73	141.30	**RDK**	30cm of strong potassic alteration followed downhole by 30cm of Qz-Ank-Chl veining with coarse Py strong in vein and in wall rock. All in a small Rhyolite dyke interval with contacts at 10-15 TCA.
		144.60	145.00	**MV**	Qz-annealed fault zone with fault originally at 45 TCA (S1 subparallel)
		157.03	157.77	**MV**	Faulted and clay 5% altered. S1 at 10 TCA in one orientation and fault at 15 in reverse orientation.
		178.76	178.80	**Vein**	3cm Qz-Ank vein at 60 TCA with Cpy 2% as blebs within vein.
		179.15	179.62	**MV**	Light grey/ bleached zone with strong Qz-Tm. S1 at 20 TCA locally.
		180.34	180.90	**MV**	Weak fault zone with very weak clay 1% and local rubble.
		183.18	183.45	**Vein**	Segment of a 4cm vein which has been offset/ sheared with very strong Py-Po (as Py replaement) as coarse euhedral xtals to 3mm. (Cpy) associated with vein.
		185.72	185.79	**Vein**	15mm Qz-Ank vein at 55 TCA with Py (Cpy) in vein and in 1mm Ser-Chl halo.
		186.60	186.86	**Vein**	Qz-Ank 3cm vein at 30 TCA at UCT but sheared/ strained so no clear LCT. Vein has (Cpy).
		190.20	191.05	**MV**	Interval with strong Qz 20% and intense 30% Ser alteration giving a bleached appearance. Includes a strongly sheared Qz vein with a 3cm intense Ser halo at 190.73-190.82. Py 2% locally vfg and disseminated throughout. Alteration LCT at 20 TCA

MAJOR UNIT		MINOR UNIT		ROCK CODE	DESCRIPTION
FROM (m)	TO (m)	FROM (m)	TO (m)		
194.54	198.15			**RDK**	Tan with black spots, m-cg, intensely altered RDK. Unit is locally fractured/ faulted at 20 TCA and 30 TCA in different orientations. Intensely Qz-Ser-Tm altered. Tm as fracture annealer and local anhedral xtals. Chl occasionall as fracture fill in fractures at 50-60 TCA. (Cpy) in high angle Qz veins at 60-70 TCA. LCT 25 TCA
198.15	310.00			**MV**	Medium grey with occasional tints, vfg-fg mafic volcanics. Unit is locally fractured/ rubbled but is mostly solid core. Wz 5% pervasive but locally stronger or weaker. Chl 2% as fracture fill and alteration product-- mostly associated with veining. Ser 3% patchy pervasive and strongest in association with veining. Tm 1% patchy and associated with minor amount of veining. Veining varies from very low angle TCA to high angle TCA and is Qz, Qz-Ank, Cal, Qz-Cal with many being ptygmatic or sheared. Py 3% as disseminated fg- vfg xtals and specks with minor coarse xtals to 3mm. Py content increases with depth and xtals / specks become finer with depth.
		211.00	213.50	**MV**	High strain zone at 10-15 TCA.
		221.76	221.86	**Vein**	5cm Qz-Ank vein at 70 TCA. 10mm Qz-Ser vein halo and no Sx seen.
		246.17	247.10	**MV**	Zone of intense Qz-Ser alteration with Tm subhedral xtals spotted throughout. Moderate Py 3% is mostly coarse xtals >1mm and euhedral.
		251.45	251.85	**IF**	Apparent IF interval. Rock is vfg Qz-Chl-Mt-Py. Mt 30 as xtals to >1mm and euhedral.
		255.27	255.37	**Vein**	15mm Qz-Ank vein at 30 TCA and perpendicular to foliation and shear. Vein has a core of Py-Mt. Py is vfg but in blebs with Mt.
		264.06	264.54	**Vein**	44cm Qz-Tm-Ank vein at 45 TCA (perpendicular to S1). Vein has vfg blebby Py in 1 fracture and a very small (Asp-Cpy).
		268.27	269.16	**Vein**	Qz-Cal-Ank-Ser-Chl vein. Vein is near CA parallel but also has ladder vein style sections/ connections where it is near CA perpendicular. Lower end of vein is intensely Ser flooded.
		276.70	277.00	**Vein**	Qz-Ser-Chl 18cm vein at 40 TCA. Immediately downhole of vein there is a 5cm section of fault gouge clay at 40 TCA.
		277.00	309.03	**MV**	Rock becomes highly strained and weakly faulted/ strongly locally fractured to EOH with Py 10% as bands of shear fill vfg xtals with Qz. Py appears to be Po replaced locally but is non-magnetic. Strain, shear, and S1 are all subparallel to parallel at 20 TCA.
		285.26	285.60	**Vein**	18cm Qz-Ank-Chl vein at 40 TCA cutting foliation and shear/ strain. 10cm Qz-Py-Ser-Tm halo.
		298.38	298.88	**Vein**	Ptygmatic Qz-Ank vein at 20 TCA with Py strong in both vein and halo.
310.00				**EOH**

SUMMARY

0.00-30.80m: Overburden.
30.80-364.00m: Basaltic pile with minor rhyolite dykes. Local pillows and brecciation. Patchy alteration but often strong and composed Qz+/-Ser+/-Chl+/-Tm. Clastic zones often exhibit intense Ser alteration in clasts but not in matrix. Mixture of veining composed of Qz+/-Cal+/-Ank+/-Ser+/-Tm+/-sulfides. Mixed halos and halo strengths aas well as vein orientations with strongest sulfides associated with higher angle veining (50-60 TCA). (Sph-Cpy-Asp) in minor local concentrations associated with veining and/ or brecciation. Py 1%-Po 0.5% locally concentrated and varying from vfg to coarse Py xtals.

DDH #: **UB17-002**

Logger: J. Rensby

MAJOR UNIT		MINOR UNIT		ROCK CODE	DESCRIPTION
FROM (m)	TO (m)	FROM (m)	TO (m)		
0.00	30.88			**OVB**	
30.88	364.00			**MV**	Light grey to locally dark green tinted, fg to vfg mafic volcanics and locally volcanoclastics. Unit is locally fractured and faulted. Uphole in unit is strongly crackle/ hydrothermally brecciated. Matrix for crackle breccia is Qz-Cal-Ank. S1 at 45 but mostly obscured by alteration. when clastic alteration varies within and without clasts. Locally dm scale pillows can be seen with Qz-Tm-Cal altered rinds. Qz 20% strong and pervasive. Ser 7% patchy and weak to intense. Veins from veinlets to larger veins at assorted orientations and are often sheared or in segments. Halos vary from nil to 5cm with locally Qz-Ser-Tm-Py-Cal-Chl. Py 1% as vfg specks patchily disseminated with a strong vein association. (Cpy, Sph) in association with a minor number of veins, usually at greater than 45 TCA.
		32.54	32.67	**Vein**	3cm Qz-Ser-Chl vein at 50 TCA with a 1cm ingtense Ser-Qz halo.
		33.12	33.26	**Vein**	5mm Qz-Ser-(Sph) vein at 55 TCA with a 5cm Ser-(Sph) halo.
		51.50	51.90	**MV**	Zone with voids and vugs where Cbate has dissolved.-- Possibly annealed fault.
		52.50	54.05	**MV**	Very strong crackle breccia through this interval and intense Qz-Ser alteration. Some clasts in this zone are Qz-Cal-Py altered and others are Qz-Ser-Tm altered.
		54.47	57.76	**FZ**	Fault zone which has been Qz-Ank annealed and then refaulted. Faulting at CA subparallel to 20 TCA with minor local fault gouge.
		62.90	74.30	**MV**	Clastic mafic volcanics. Clasts are rounded to angular and 5mm- 10cm. Clasts are Qz-Ser-Tm altered
		74.80	75.00	**Vein**	3cm Qz-Cal veinat 20 TCA with a 2mm Qz-Ser halo and Py 3% as vfg disseminated specks in surrounding rock but not in vein.
		89.33	89.43	**Vein**	4cm Qz-Chl-Cal vein at 55 TCA. Vein has a 2mm strong Chl-Ser-Qz halo.
		89.50	121.00	**MV**	Chl is increased and Ser decreased as rock becomes more light green but remains a volcaniclastic. Alteration is now broadcast Qz-Chl-(Ser). Clasts continue to be Qz-Ser-Tm-Py altered. Chl begins to diminish again at 121.
		106.40	106.46	**Vein**	Broken and sheared Cal-Rho 5mm vein with a 1mm Ser halo.
		123.50	124.30	**MV**	Intensely Qz-Ser-Tm altered zone with (Py) and strong shearing.
		128.20	128.50	**Vein**	Series of Qz-Ank sheared veinlets to 7mm with 1-2mm Ser halos and Po-(Cpy) in veins.
		137.80	137.85	**Vein**	5cm QZ-Ank-Ser vein at 90 TCA which cuts a pillow. Vein 85 UCT and irregular LCT in pillow. No Sx seen.
		140.86	141.10	**Vein**	2 veins-- 15mm Ank-Qz-Ser and 20mm Qz-Ser. Veins at 30 TCA at opposite orientations to one another meet. Qz-Ser is locally Ank replaced. Po-Py-Cpy seen in both veins.
		150.00	150.50	**Vein**	Series of 3 subparallel Qz veinlets at 45 TCA with up to 10cm Po-Qz-Ser-Ank alteration halo. Po 10%-Py 1%-(Cpy) through this zone. Po vfg-Py and Cpy in small blebs <1mm.
		151.16	151.63	**MV**	Interval with intense and pervasive Qz-Ser-Ank-Po-Py-Tm alteration. Po 5%- Py 0.5% as clusters of concentrated vfg specks.
		156.00	162.00	**MV**	Ank annealed breccia/ fault zone. Ank fracture fill and fragments throughout as Ank is 20% in this zone.
		164.43	164.80	**MV**	Strongly Ser-Qz altered interval with brecciation and preferential alteration between matrix and clasts. Immediately downhole is a band of intense Ser alteration bordered by 2 Qz-Ak 4mm veinlets at 30 TCA with 2mm Chl-Qz halos. (Py) locally.
		169.02	169.24	**Vein**	Qz-Ank 3cm vein at 45 TCA crosscutting a pillow. Qz-Ank-Chl-Tm are mixed in pillow rind. Po 2% disseminated locally throughout vein and rind.
		171.90	172.35	**FZ**	small fault zone with minor clay. Faulting at 10 TCA.
		177.30	177.80	**MV**	Segments of Qz-Cal through this interval-- appears to be partially shearing of veins and partially fracture fill/ annealer.

MAJOR UNIT		MINOR UNIT		ROCK CODE	DESCRIPTION
FROM (m)	TO (m)	FROM (m)	TO (m)		
		180.75	180.92	**Vein**	2cm Qz-Ank-Py vein at 25 TCA with Ank-Qz ladder steps and a 2mm Chl-Ser halo. 2 similar and subparallel of same in following m.
		182.50	182.65	**Vein**	Qz-Cal-Rho-Ser-Po 5mm veinlet at 45 TCA with Qz-Cal-Ank strongly altered halo downhole.
		184.25	184.75	**FZ**	Minor fault zone with fault gouge at 10 TCA. Mariposite/ Fuchsite (Fuch) as fracture fill and in clay.
		185.93	186.01	**Vein**	Sheared Cal-Qz veinlet segments with (Po-Py-Cpy) in this zone.
		186.43	186.50	**MV**	Pillow rind altered with Ser-Qz-Ank-Po-Tm
		195.45	195.52	**MV**	5cm x 7cm Qz eye/ vein segment with Ank-Cal-Ser-?Stibnite? Within Qz and halo.
		196.86	197.30	**MV**	Within this interval pillow rinds are Qz-Cal-Ank-(Po) altered.
		211.10	216.73	**BX**	Breccia zone with patchy strong breccia-- pillows are Ser altered and unbrecciated with matrix and clasts to 3cm and Qz-Ser-(Ank) altered. Po 7% as disseminated specks to clusters/ blebs and bands of vfg Po with Qz and a strong vein association. Blebby Cpy 0.2% with Po. (Asp) disseminated throughout as vfg-fg xtals and blebs.
		217.90	218.30	**MV**	Asp 0.1% disseminated throughout as vfg-fg xtals in Ser-rich altered rock.
		222.35	222.52	**MV**	Qz-Ank-Ser strong alteration zone (?small pillows?) with Po 7% through this interval.
		223.90	224.25	**MV**	Qz-Ank-Ser strong alteration zone (?small pillows?) with Po 5%- Py 1% through this interval.
		225.25	225.48	**MV**	Qz-Chl-Cal-Ser altered pillow rind with Po 5%- Py 3%-(Asp)
		226.71	226.76	**Vein**	5mm Qz-Ank vein at 65 TCA with a Ser-Py-Po halo. (Fuch) in vein and halo.
		227.22	227.60	**Vein**	5mm Qz-Ank vein at 65 TCA with a Ser-Py-Po halo. (Fuch) in vein and halo.
		232.35	232.45	**Vein**	3mm Qz-Ank veinlet at 40 TCA cut by a Cal-Qz veinlet at 40 TCA in reverse orientation. Qz-Ank has Po-Py in vein and halo as clusters of vfg specks/ xtals.
		233.00	241.70	**MV**	Qz-Ank strong alteration and veining (mostly veinlets) strong through this zone of Po 5%- Py 3%. Patchy Ser zones.
		245.30	245.50	**MV**	Interval of intense Ank 30%- Qz 25% alteration with minor spots of Fuch
		255.00	257.00	**MV**	Pillows through this section are stretched parallel to S1 (35 TCA) with minor Py found within pillows.
		269.70	269.95	**Vein**	2 S1 subparallel (20 TCA) Qz-Ank veins with 2mm Ser-Qz halos and 2cm Py-Po-(Asp) halos. Sx are vfg.
		275.20	275.35	**MV**	Chl-Ank-Qz altered pillow rind with vfg Py 1%-Po 1%
		284.50	285.20	**Vein**	Qz-Ser-Chl-Py-(Po) vein at 30 TCA. Vfg Py seen in halo.
		291.06	291.40	**MV**	Sph and Py in Qz-Cal-Chl veinlets to 2mm.
		291.70	293.84	**MV**	Clastic interval with grey MV which are Chl altered with rounded mafic clasts. Qz veinlets are <1mm and often <1cm apart. S1 35 TCA with a minor undeterminate crenulation cleavage (S2)
		294.00	295.50	**MV**	Grey Ser altered interval with abundant (5%) Qz veinlets at 35 TCA.
		298.50	298.60	**Vein**	Sheared Qz veinlets with Py-Ser halos
		298.90	298.95	**Vein**	Qz-Cal-(Ank) vein at 30 TCA and in opposite orientation to S1
		300.50	300.60	**Vein**	Sheared Qz-Ser vein at 45 TCA with Ser halo with minor fg Py and Chl
		300.80	300.90	**Vein**	fg Py in fg clay at an annealed Qz vein at 45 TCA
		301.40	301.60	**MV**	Ser alteration band at 30 TCA
		303.50	303.60	**Vein**	Qz-Ser-Ank vein at 45 TCA. 7cm with 2% Py in alteration halo.
		304.00	306.30	**BX**	Breccia zone with Qz-Chl clast fill. Py-Po clasts/ phenocrysts in clusters. Local Ser alteration interspersed with Qz infill and Chl alteration. Py-Po strongest at boundaries of Qz.
		305.23	305.29	**Vein**	Chl replaced Qz vein with a Py-(Po) core 1cm and 55 TCA.

MAJOR UNIT		MINOR UNIT		ROCK CODE	DESCRIPTION
FROM (m)	TO (m)	FROM (m)	TO (m)		
		307.30	308.80	**Vein**	Interval with Qz-Ser-Chl vein system of veinlets at 40 TCA with associated Py 3%
		314.00	314.03	**Vein**	1cm Qz-Cal-Ank vein at 40 TCA
		314.50	316.95	**MV**	Chl strong 20% alteration zone with local mg euhedral Py
		317.70	317.90	**Vein**	Qz-Cal-Chl-Ank veinlets at 45 TCAin this interval.
		319.5	319.56	**Vein**	Qz-Cal 2cm vein at 35 TCA
		321.70	322.00	**Vein**	Series of Qz-Ser-Ank veinlets with minor associated Py.
		329.00	330.00	**MV**	Chl-Qz-Ser altered zone with Qz fracture fill and patchy Ser-Chl alterations.
		334.85	337.00	**RDK**	Light grey, vfg rhyolite dyke with very weak Qz-Ser alteration. Homogenous with (Py) disseminated.
		340.50	341.50	**MV**	Interval with blebby semi-massive Py 50% and Chl 20% strong alteration.
		343.00	364.00	**MV**	Mineralization and alteration dissipate and diminish with increased depth. Very minor coarse Py.
364.00				**EOH**

SUMMARY

0.00-22.90m: Overburden.

22.90-289.00m: Mafic volcanics. Qz-Ser alteration throughout with local Chl-Ank-Tm. Mixed veining of Qz-Ser-Ank-Cal-Chl-Tm and local pillow rinds of Qz-Tm-Chl-Py. Py 0.5% (Po-Cpy-Sph) associated with vein systems and strongest alteration.

DDH #: **UB17-003**

Logger: J. Rensby

MAJOR UNIT		MINOR UNIT		ROCK CODE	DESCRIPTION
FROM (m)	TO (m)	FROM (m)	TO (m)		
0.00	22.90			**OVB**	
22.90	289.00			**MV**	Light grey with local yellow tinted sections, vfg mafic volcanics with local minor clasts and amygdules. Unit is mostly competent with very minor rubbled/ fractured sections. Foliation (S1) generally close to 35 TCA with minor local variations. Qz 20%- Ser 10% pervasive throughout with local high concentrations. Chl 10% pervasive throughout. (Ank-Tm) vein associated. Veining mostly veinlets at a variety of angles TCA and comprised of mixes of Qz-Cal, Qz-Ank, Qz-Chl, and Qz-Ser-- all often with additional members of this group (eg Qz-Cal-Chl). Halos vary but generally minor (<2mm) and comprised of Ser-Chl-(Py). Py 0.5% as mostly disseminated fg specks and xtals is very weak uphole and increases with depth. (Po-Cpy-Sph) found locally and usually in association with veining.
		23.04	23.11	**Vein**	2cm Qz-Chl vein at 65 TCA. Chl as a 1cm band cutting across vein. 2mm Ser-Py halo. Py as vfg specks and clusters of same.
		33.45	35.90	**MV**	Zone of very intense Qz-Ser alteration with minor Ank altered clasts to 2cm and Ank altered amygdules to 5mm. Py 2% as vfg disseminated specks/ xtals.
		45.18	45.26	**Vein**	Qz-Tm-Ank 2cm vein at 55 TCA with a 1mm Ser-Chl halo and a 5mm Po halo. Po as very small amorphous blebs.
		47.93	48.45	**MV**	Qz-Ser intensely altered interval with (Py-Po) as vfg xtals and specks.
		53.04	53.40	**Vein**	1cm Qz-Chl-Cal-(Ank) vein at 15 TCA. Vein has an up to 5cm Ser-Chl-(Po) halo and Po 2%-Py 1%-(Cpy) in vein.
		58.70	58.95	**Vein**	15mm Qz-Chl-Cal vein at 15 TCA. Clay-Ser on vein edges with Ser-Qz 5mm halo. (Sph-Py-Po) within vein
		72.80	73.02	**MV**	Ser 50% intense zone-- possibly as a vein halo as there are 2 Qz-Ank veinlets subparallel to one another at 25 TCA.
		73.90	75.59	**MV**	Ser 50% intense zone-- possibly as a vein halo as there are multiple Qz-Ank veinlets subparallel to one another at 25 TCA. Also locally Qz-Cal veinlets at 20 TCA.
		76.64	77.15	**MV**	strong Ser alteration in an angular rubble zone.
		77.37	78.76	**MV**	interval of coarser grained flow with minimal alteration beyond Qz 7%
		79.30	79.43	**Vein**	12cm Qz-Chl-Cal-Ser vein at 65 TCA. LCT is brecciated and there are country rock inclusions within vein. Vein has a 15 cm Qz-Ser-(Py) halo.
		80.38	80.77	**MV**	Ser 50% intense zone-- possibly as a vein halo as there is a Qz-Ank veinlet at 25 TCA.
		82.20	83.00	**MV**	Py 7%-(Po) locally
		85.76	85.97	**Vein**	Series of veins to 1cm at 45TCA (S1 50 locally) of Qz-Cal-Chl-Ank. Py 7% as cg xtals to 3mm.
		90.87	91.30	**MV**	Intensely Qz-Ser-Cal interval with (Py) and a very minor (Asp)
		95.98	96.14	**MV**	Trio of Qz-Cal veinlets at 65 TCA. 5cm Qz-Ser-Chl halos with specks (Asp-Sph) in halo.
		161.90	171.80	**MV**	Silicified 25% zone with minor Qz-Cal-Ank-™ veinlets patchy and weak throughout. Extremely minor (Py) as fg specks.
		171.80	173.60	**MV**	interval of angular rubble
		188.60	189.60	**MV**	interval with 60% angular rubble-- no fault gouge.
		192.00	192.46	**MV**	Series of veinlets to 6mm, all less than 15 TCA in various orientations. Veins are all Qz-Cal-Ank with 2mm Qz-Ser halos. No Sx seen.
		195.50	195.98	**MV**	Series of Qz-Cal veinlets <3mm and all <15 TCA with Ser-Qz halos. (Asp) seen in halo at a junction of 2 veinlets.

MAJOR UNIT		MINOR UNIT		ROCK CODE	DESCRIPTION
FROM (m)	TO (m)	FROM (m)	TO (m)		
		206.71	206.78	**Vein**	6mm Qz-Cal at 45 TCA (S1 subparallel) with a 1mm Ser halo and weak Po in adjacent rock as vfg specks. (Asp) in vein is vfg.
		217.87	217.97	**Vein**	1cm Qz-Chl-Cal-Ser vein crosscutting foliation (S1) at 45 TCA. Vein contains (Cpy) blebs and has (Po-Py) in halo to 5mm.
		219.60	220.50	**MV**	Strong angular rubbling followed by a 50cm Ser-Qz-Cal annealed fault zone. (Asp) in annealing as vfg specks.
		232.16	232.26	**Vein**	Kinked 15mm vein at 25/ 50 depending on side of core observed. Qz-Ser with a 3mm Ser halo and (Py) locally.
		236.60	239.15	**MV**	Interval starts with 2 Qz-Ak-Ser veinlets <7mm at near CA perpendicular with (Asp) between them. Continues as an intense Qz 60-Ser 30 alteration zone with local intense banding and broadcast alteration locally.
		239.15	240.90	**MV**	Clastic zone with clasts/ amygdules with Qz-Ank alteration and Py 2% as blebs disseminated throughout.
		241.00	252.50	**MV**	Chl strong to intense zone with Qz-Chl-Ank-Ser veining (mostly sheared segments). Minor local Py 1%
		241.45	241.52	**Vein**	Interval with very minor extremely fg (Asp). No Sx at all following downhole.
		248.80	252.40	**MV**	Multiple Qz-Ser veins- Ser is only in the 2mm halos. Minor Po and (Cpy) in some. Veins to 1cm and at 20-30 TCA.
		258.80	264.00	**MV**	Zone with many Ak-Qz veins to 3cm-- no Sx seen.
		276.25	276.29	**Vein**	1cm Qz-Ak vein at 60 TCA with (Cpy) in vein
289.00				**EOH**

SUMMARY

0.00-11.20m: Overburden.

11.20-110.27m: Mafic volcanics, locally intensely fractured to faulted with minor gouge.
110.27-117.40m: Rhyolite dyke.
117.40-219.20m: Mafic volcanics, volcaniclastics, locally pillowed.
219.20m: **EOH**

DDH #: **UB17-004**

Logger: J. Rensby

MAJOR UNIT		MINOR UNIT		ROCK CODE	DESCRIPTION
FROM (m)	TO (m)	FROM (m)	TO (m)		
0.00	11.20			**OB**	
11.20	110.07			**MV**	Dark green, almost irridescent, vfg mafic volcanics. Unit is locally strongly fractured and faulted with minor local fault gouge. Unit is soft enough to be locally heavily drill scarred. Fracturing commonly between CA subparallel and 25 TCA. Chl 30%-Ser 20% strong throughout and locally 1 or the other is intense. Qz 5% weak but pervasive. (Clay) throughout with local fault gouge. Veining is mostly near CA parallel or as fragments due to pervasive shear. Composed of mixes of Qz-Chl-Cal-Ank-Ser with strong Ser halos to cm scale and Py-Cpy-(Po) within veins and halos. Py 2% (Po) varies from nil to very strong locally as xtals, specks, and clusters of vfg xtals to 2mm with a strong vein association. Cpy 0.1% as Py replacement/ pseudomorph within veins and halos. (Sph) as specks and blebs within veins (very small minority) and minor local disseminated.
		18.10	18.25	**Vein**	1cm thick Qz-Cal-Ank vein fragment at ~10 TCA. (Sph) in vein.
		21.10	22.00	**FZ**	Fault gouge zone with clay and rubble-- orientation indeterminate.
		30.00	38.00	**MV**	Through this interval Ser alteration is increased and Chl strength is reduced. (Cpy) seen through this zone.
		30.25	30.55	**FZ**	Small fault zone with fault gouge at 35 TCA. Cpy in rock just uphole at 30.19.
		31.95	32.33	**Vein**	Subparallel Qz-Cal veinlets at 35 TCA. Py 3% between these veins with (Sph).
		46.50	52.00	**MV**	Interval with strong Py 2%-Qz-Tm in rinds of pillows.
		48.70	48.85	**Vein**	6mm Py-Cal-Qz vein at 40 TCA with strong local Py as blebs.
		49.84	49.96	**MV**	Pillow rind of Py-Qz-Cal-Tm replacement
		51.70	51.93	**MV**	Py-Qz-Cal-Tm filled pillow rind.
		62.67	62.96	**Vein**	Twin Qz-Ank-Chl-Ser 15mm veins at 40 TCA with Ser halos and coarse Py 3% locally.
		82.20	82.21	**MV**	Spot of Po seen
		85.75	85.97	**MV**	Qz-Cal-Chl-Ank veining / alteration zone at 45 TCA with coarse and minor fg Py 5% throughout zone and outer edges.
		95.62	95.70	**Vein**	1mm Qz-Ank vein at 40 TCA with a 3mm Qz-Ser halo. Adjacent fracturing contains Po- (Asp).
		106.96	107.49	**MV**	Interval of low angle (20-30 TCA) sheared Qz-Ank-Ser-Chl-Cal veining to 1cm which crosscuts pillow rinds. Clusters of fg Py 3%-(Po-Sph) in this zone.
		109.00	110.00	**FZ**	Weak fault with very minor gouge at 20 TCA. Minor Fuch- fault may be contact related.
110.07	117.40			**RDK**	Light grey, locally weak brown tinted, fine to coarse grained rhyolite dyke. Dyke has weak chill margins to 5cm and is only weakly fractured. Contacts are at 20 TCA. Weak pervasive Kspar 3% alteration. Minor veining is Qz-Cal-Ank-Py with Py within veins. Py 2% as fg xtals disseminated throughout.
117.40	219.20			**MV**	Deep green to light grey, fg mafic volcaniclastics with local pillows. Unit contains very minor local faulting but is highlly fractured at near CA parallel. Pillows are cm to dm scale with Qz-Cal-Tm+/-Py filled rinds. Qz 25%-Ser 15% are pervasive throughout but locally weak to very strong. Chl 7% is patchy and locally nil to strong. Veining is a mix of Qz-Cal-Ank-Chl-Ser-Tm and mm-cm scale with associated Py in some cases.Often veins are 2-4 constituents eg Qz-Cal-Ank. Py 2% (Po) disseminated patchily throughout aas xtals to 2mm and as clusters of vfg xtals, mostly in pillow rinds.
		117.40	124.90	**MV**	Interval of abundant vein fragments and a 1-3cm Qz-Cal-(Ank) vein with Py 1% as fg xtals. Vein is CA subparallel to 119.5. Minor faulting at 10-15 TCA with (clay) and Chl on most fractures.
		121.52	121.78	**FZ**	Fault zone with angular rubble and minor fault gouge at 10 TCA.
		138.15	139.10	**MV**	Interval with intense Ser and abundant Qz-Cal vein fragments with both coarse and fg Py 3%.
		145.00	145.20	**MV**	Pillow rind with Qz-Cal-Tm-Py 2% and possible (Sph).

MAJOR UNIT		MINOR UNIT		ROCK CODE	DESCRIPTION
FROM (m)	TO (m)	FROM (m)	TO (m)		
		145.50	146.50	**Vein**	Strongly Qz-Cal-Chl-Tm veined interval with minor Py 0.5%. Mostly fragments but also some at 20TCA and up to 2cm.
		150.35	150.39	**Vein**	2cm Qz-Chl vein at 50 TCA with associated Py.
		151.50	162.00	**MV**	Pillow rinds are Ser-Ank altered and contain fg-mg Py 3%. Rinds are dm scale and appear as if veins in the core.
		163.20	163.24	**Vein**	Qz-Chl-Ank-Py vein at 50 TCA with strong Py 5% mineralization.
		163.85	164.00	**MV**	Intense Qz-Chl-Ank-Py alteration zone.
		165.30		**MV**	Pillow rind intersection with Qz-Chl-Py-(Cpy)
		165.50		**Vein**	Qz-Ank-Chl-Py-(Cpy) vein at 40 TCA
		168.00	169.00	**MV**	Intense Ser alteration zone.
		170.00	171.00	**MV**	Very strong CHl alteration zone with minor Qz-Ank veinlets.
		171.00	174.50	**MV**	Pillow rinds are larger through this interval and have Py 5% mineralization. Veining through this zone is Qz-Ank at 55 TCA.
		181.18	181.18	**MV**	1mm Cpy bleb seen in a Qz fragment
		183.05	183.15	**Vein**	7mm Qz-Cal vein at 30 TCAwith a 3mm Ser-Chl halo meeting a pillow rind of Qz-Tm-Py
		190.94	191.00	**Vein**	2cm Qz-Ank-Chl-Ser vein at 65 TCA with a 1cm Ser-Chl halo and local Py blebs. Possible Sph bleb but not same colour as previously seen.
		194.60	194.90	**MV**	Fractured/ broken interval with pink quartz on most fractures.
		202.59	202.72	**MV**	Pillow rind has been replaced by a Qz-Cal-Chl-Ank vein with very weak Py 0.5% in wall rock
		211.33	212.00	**RDK**	Light beige with black fractures, fg rhyolite dyke. Pervasively Qz 15% altered with Tm 2% on fractures. No veining. UCT 25, LCT irreg.
		212.00	212.77	**Vein**	Multiple veins which have replaced pillow rinds. Veins to 5cm are Qz-Chl-Fuch-Ank-Tm with cg Py 3% within and Ser-Qz-Py halos.
219.20				**EOH**

SUMMARY

0.00-17.37m: Overburden.
17.37-46.95m: Mafic volcanics.
46.95-49.10m: Rhyolite dyke.
49.10-189.00m: Almost exclusively mafic volcanics with local cm to dm scale pillows and local volcaniclastic to brecciated intervals. Qz and Ser alteration are pervasive and only vary in local intensity while Chl is patchy and locally pervasive. Tm spotty throughout. Patchy localized Ank 1% alteration including annealing fractures. Py can be coarse xtals to 2mm or vfg xtals, sometimes in clusters, varies from nil to 10% locally and is <1% overall. Minor traces locally of Sph, Po, and Cpy; usualy vein associated. Most commonly veins are at low angles and near S1 subparallel or x-cutting at 50-70 TCA. Veins are a mix of Qz-Cal-Tm-Ank-Ser with halos of Qz-Ser-Py.

189.00m: EOH

DDH #: **UB17-005**

Logger: J. Rensby

MAJOR UNIT		MINOR UNIT		ROCK CODE	DESCRIPTION
FROM (m)	TO (m)	FROM (m)	TO (m)		
0.00	17.37			**OB**	
17.37	46.95			**MV**	Medium grey with local weak green tint, vfg mafic volcanics with local pillows, clastic units, and brecciation. Unit is generally competent. Pillows are at cm-dm scale and seen locally with Qz-Tm+/-Py fill. Patchy amygdules to 4mm are Qz-Ank, Qz-Tm, or Qz-Chl filled/ replaced. Qz 15% is pervasive but locally weak to very strong. Ser 10% also pervasive but varying in local strength. Chl 5% is strongly pervasive but patchily so. Veining <1% is Qz-Ank or Qz to 25mm with very minor Ser halos and coarse Py in veins and halos. Py 3% as coarse xtals to 3mm, and as minor specks or blebs disseminated patchily throughout with a strong vein association. (Po-Cpy-Asp-Sph) as local concentrations, all vein associated.
		28.80	28.88	**Vein**	25mm Qz-Ank-Py vein at 45 TCA crossing foliation. Py is xtals to 2mm.
		37.40	37.60	**MV**	Strong Py and (Asp-Sph) bleb <1mm seen in this interval.
		46.78	46.82	**Vein**	3mm Qz-Tm vein at 20 TCA with (Po-Cpy) within vein. Proximal to contact with dyke.
46.95	49.10			**RDK**	Medium tan to grey, fg to cg rhyolite dyke. Minor pervasive Qz 5% alteration and minor Qz veinlets to 3mm at assorted angles TCA. Py 3% disseminated throughout as fg xtals.
49.10	189.00			**MV**	Light to medium grey with local dark green tint, vfg mafic volcanics. Unit is locall fractured but generally competent. S1 varies from 20 to 40 TCA locally and S2 varies from 10 to 30 TCA in the opposite orientation. Qz 10% is pervasive but locally weak to very strong. Ser 5% is patcjy pervasive. Chl 2% patchy but often strong when present. Unit has abundant amygdules to 4mm which are Qz, Qz-Tm, or Qz-Sph filled/ replaced. Veining is <<1% is Qz-Ank or Qz-Cal and often near 45 TCA. MInor Qz-Ser halos to 1mm associated with veins. Py 3% disseminated throughoutas vfg specks to xtals to 2mm. (Sph) as amygdule replacement. (Cpy) associated with Py-Sph
		49.85	50.16	**RDK**	Dyke fragment. Contains no veining and no elevated Py at contacts with volcanics.
		60.13	60.39	**MV**	Interval with strong Ser-Chl, coarse Py, and (Sph) as replacement in amygdules with Qz-Tm-Py
		61.20	67.00	**MV**	Interval with strong Ser-Chl, coarse Py, and (Sph) as replacement in amygdules with Qz-Tm-Py but more patchy and only locally are all amygdules altered this way. Can often be a small percent that is Sph altered.
		73.88	73.93	**Vein**	2cm x 4cm Qz-Chl-Tm eye with ?Sph? And fg Py in clusters in a zone of stretched amugdules.
		84.00	92.00	**MV**	No sulfides and extremely limited veining through this section.
		99.88	100.44	**Vein**	46cm Qz-Tm-Ser-Chl-Ank-Cal vein system-- appears as a series of veins or injections with differing alteration in bands. Also appears brecciated. UCT 70 LCT irregular but low TCA. Vein has a 10cm Ser halo on the downhole side and contains Po 1%-Py 1%-(Sph-Cpy-Asp)
		105.90	105.90	**MV**	(Cpy) as a bleb <2mm
		109.10	109.12	**Vein**	Qz-Tm-Cal-Ser vein with fingers- widest part is 1cm. General trend of 60TCA. (Py) in vein.
		113.25	113.43	**Vein**	Qz-Tm-Clay 10cm band with Py
		117.65	118.20	**MV**	Blebby Py filling shears with Qz and Cal.
		124.38	124.38	**MV**	(Cpy) within an irregular Qz-Cal vein meeting a 3mm Qz-Cal vein at 25 TCA. Qz annealled fault downhole.
		117.00	132.80	**MV**	Locally alteration is intense within this zone and either Qz-Ank or Qz-Ser.
		130.28	130.84	**Vein**	Series of Qz-Cal-Ank-Tm-(Py) veins/ bands at 20 TCA and all connected.
		132.89	133.61	**MV**	Qz-Ser-Ank-Py shear fill/ series of bands with Py 10%-(Cpy)
		139.50	182.00	**MV**	Clastic to brecciated interval with stretched clasts to 7cm x 3cm throughout-- either Qz-Ser or Qz-Tm
		134.80	135.35	**Vein**	Qz-Cal vein zone with a 1cm and a 5cm both at 25 TCA. Only minor fg (Py) locally.

MAJOR UNIT		MINOR UNIT		ROCK CODE	DESCRIPTION
FROM (m)	TO (m)	FROM (m)	TO (m)		
		154.17	154.80	RDK	Light grey, fg-cg Rhyolite dykelet with Qz 10% alteration and no veining. (Py) weakly disseminated.
		182.00	189.12	RDK	Tan/ light grey, vfg Rhyolite dyke with pervasive Ank 3% spotting. Pervasive Qz 5% and Ser 1%. Unit
